

# COPEPODS AS POTENTIAL MICROPLASTIC RESERVOIRS IN GLOBAL OCEANS: INTEGRATING EMPIRICAL DATA AND SYSTEMATIC REVIEW ANALYSIS.

Valentina Fagiano, Montserrat Compa, Carme Alomar, M.L. Fernández de Puelles and Salud Deudero

### 1. INTRODUCTION Sink **Terrestrial** 000 dissolved contaminants Sources sources Abiotic reservoir Biotic reservoir plastic biogeochemical cycle Trophic transfer Fossil fuels hold 10,000 gigatonnes (Gt) of carbon 9 Gt of carbon is emitted into the atmosphere every year 7 Gt of that fossil carbon is now in the form of plastic (Zhu et al.2021 Front. Mar. Sci)

#### 1. INTRODUCTION

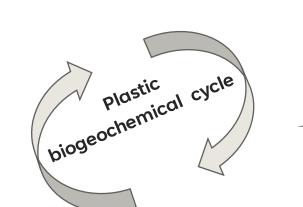

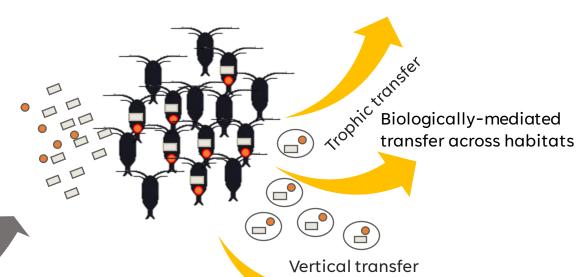

Are Copepods good candidates as a microplastic reservoir within the plastic biogeochemical cycle?

One of the most abundant metazoans on the Earth

Crucial role in carbon dynamics

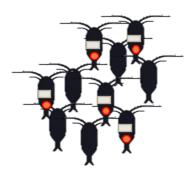

Are Copepods good candidates as microplastic reservoir within the plastic biogeochemical cycle?

Experiments in laboratory-controlled conditions

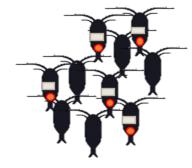

Low microplastic ingestion and low frequencies of ingestion

Are Copepods good candidates as microplastic reservoir within the plastic biogeochemical cycle?

Experiments in laboratory-controlled conditions

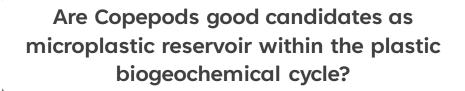

**Studies under field conditions** 

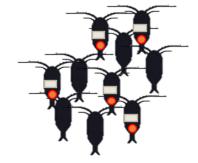

Low microplastic ingestion and low frequencies of ingestion

Generally high retention values and percentages

Experiments in laboratory-controlled conditions

Studies under field conditions

Low microplastic ingestion and low frequencies of ingestion

High retention values and percentages

### **Hypothesis**

Although marine copepods are at low risk of ingesting microplastics, their vast abundance in the marine environment potentially positions them as a significant biotic reservoir of microplastics within the 'biogeochemical' plastic cycle

To assess APs ingestion in *P. mediterranea*, and to evaluate its potential as a reservoir of APs within the Sea Surface Microlayer (SML)

Determine the abundance and population structure of this copepod specie in the study area

Evaluate the occurrence of ingestion and composition of the MPs ingested by P. mediterranea

Assess the number of MPs retained by this copepod per cubic meter

#### 3. EXPERIMENTAL STUDY - MATERIAL AND METHODS

# **EXPERIMENTAL STUDY**

- Horizontal tows (0-12 cm)
- (Manta trawlHydro-Bios manta net; mesh size: 335 μm)

#### Sampling

#### **Abundance** and characterization

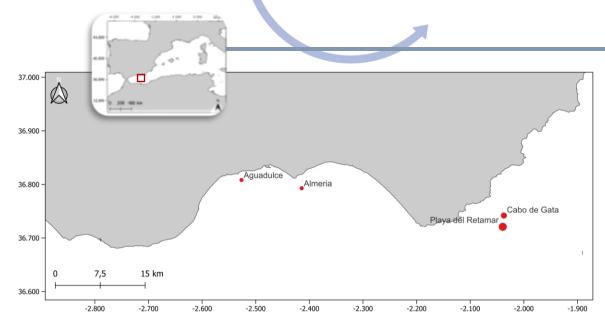

- Copepods abundance  $(ind/m^3)$
- Proportion of adults to copepodites

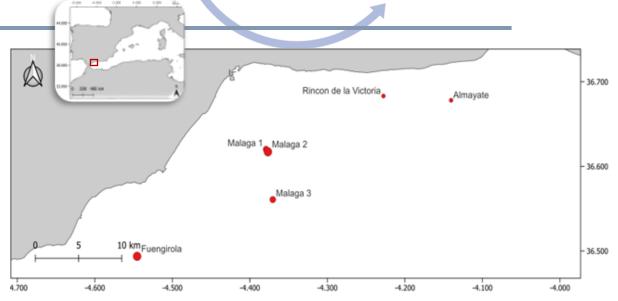

- Sampling effort: 2793 individuals (2400 adults -393 copepodites).
- Sampling effort per sampling site:  $80 \ge - \le 320$ .
  - Enzymatic digestion of 20 individuals per batch.

#### MPs ingestion

#### MPs retention

• The number of retained MPs for m<sup>3</sup> (MPs/m<sup>3</sup>) was calculated multiplying the mean ingestion (MPs/ind) by the abundance of copepods (ind/m³) found at each sampling site.

#### 4. EXPERIMENTAL STUDY - RESULTS

#### ABUNDANCE OF Pontella mediterranea IN THE ALBORAN SEA

Abundance:

1174.83 41.67 ind/m<sup>3</sup> mean: 358.23 ind/ m<sup>3</sup>

Proportion of adults to copepodites: 75:25

#### **INGESTION AND RETENTION OF MICROPLASTICS**

Microplastic ingestion:

0.19 0.05 MPs/m<sup>3</sup>

mean:  $0.11 \pm 0.05$  MPs/  $m^3$ 

Not influenced by copepod abundance (lm, p>0.05)

**Microplastic retention:** 

220.28 3.69 MPs/m<sup>3</sup>

mean: 45.15 ± 65.54 MPs/m<sup>3</sup>

influenced by copepod abundance (lm, p<0.05)

First assessment of anthropogenic particle ingestion in Pontellid copepods: Pontella mediterranea as a potential microplastic reservoir in the Neuston

#### 5. SYSTEMATIC REVIEW ANALYSIS OF EXPERIMENTAL STUDIES - OBJECTIVES

SYSTEMATIC REVIEW
To

To assess the ecological role of copepods in microplastic pollution and to explore their potential as a reservoir within the biogeochemical cycle of plastics.

To evaluate the current knowledge of microplastic ingestion and retention in copepods under field conditions through a systematic review

To assess the variability in microplastic ingestion by copepods across different studies, taxonomic aggregation levels, and habitats through a meta-analysis

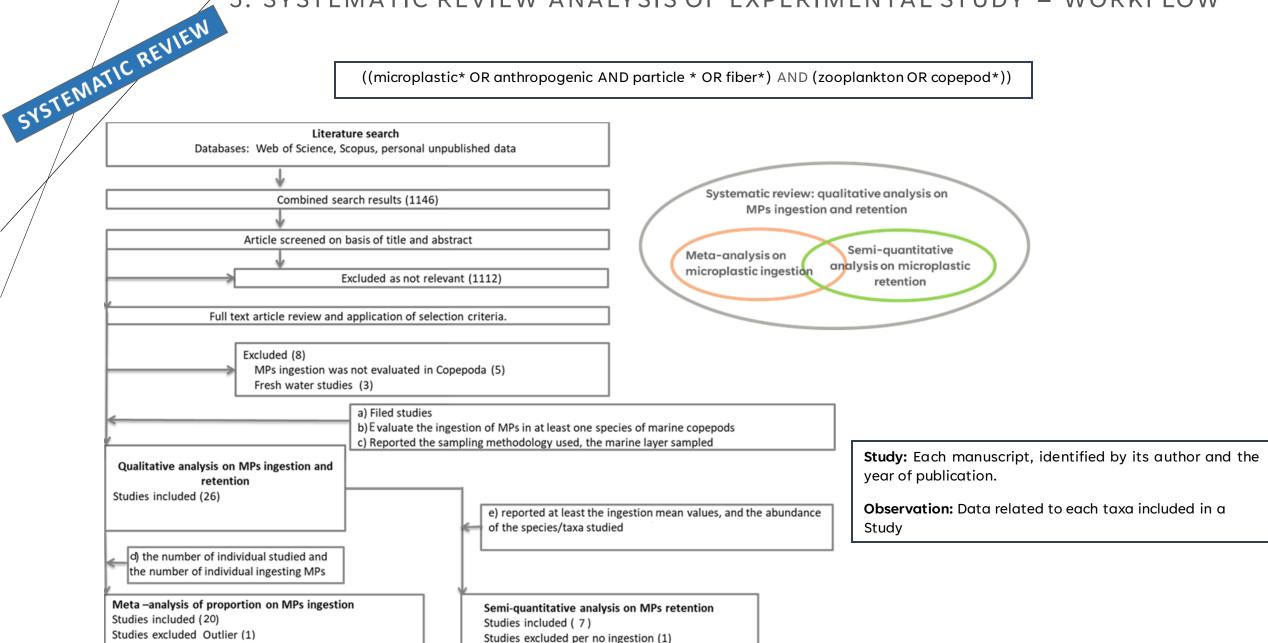

To explore the potential role of copepods as a reservoir of microplastics in the marine environment through a semi-quantitative analysis of microplastic retention

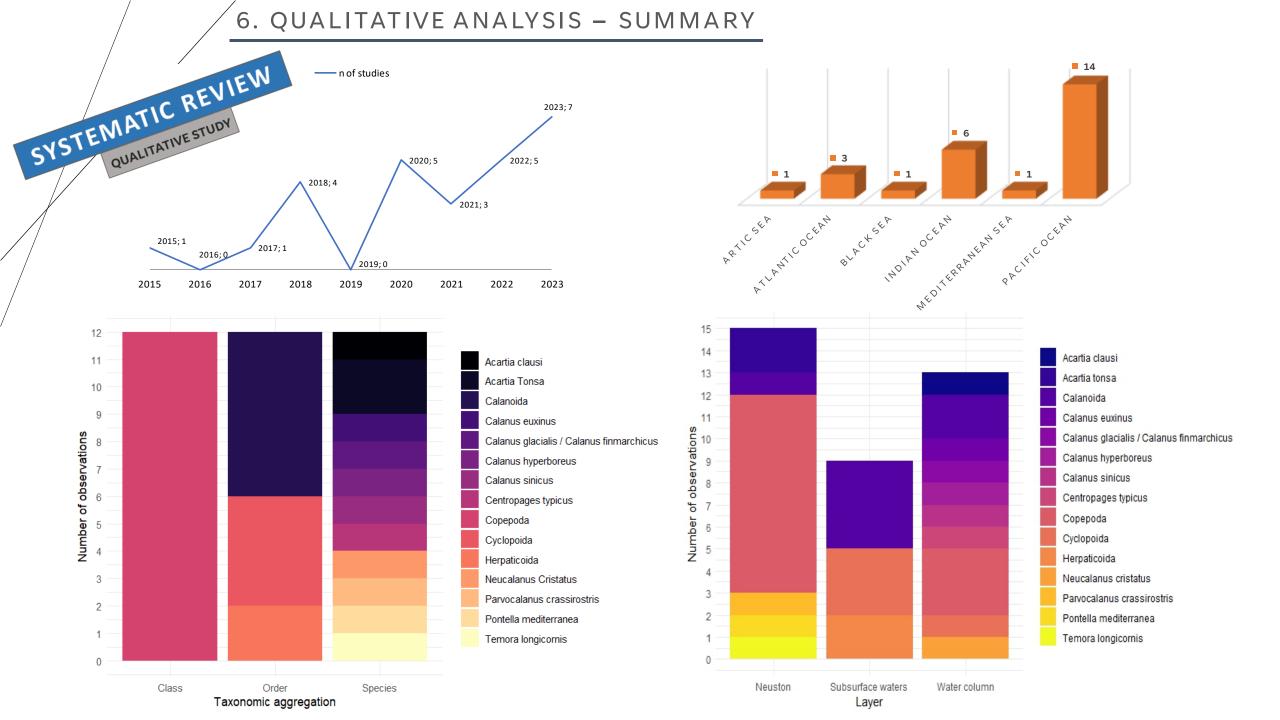

To examine, from an ecological perspective, the consequences of the interaction between microplastics and copepods in the marine environment

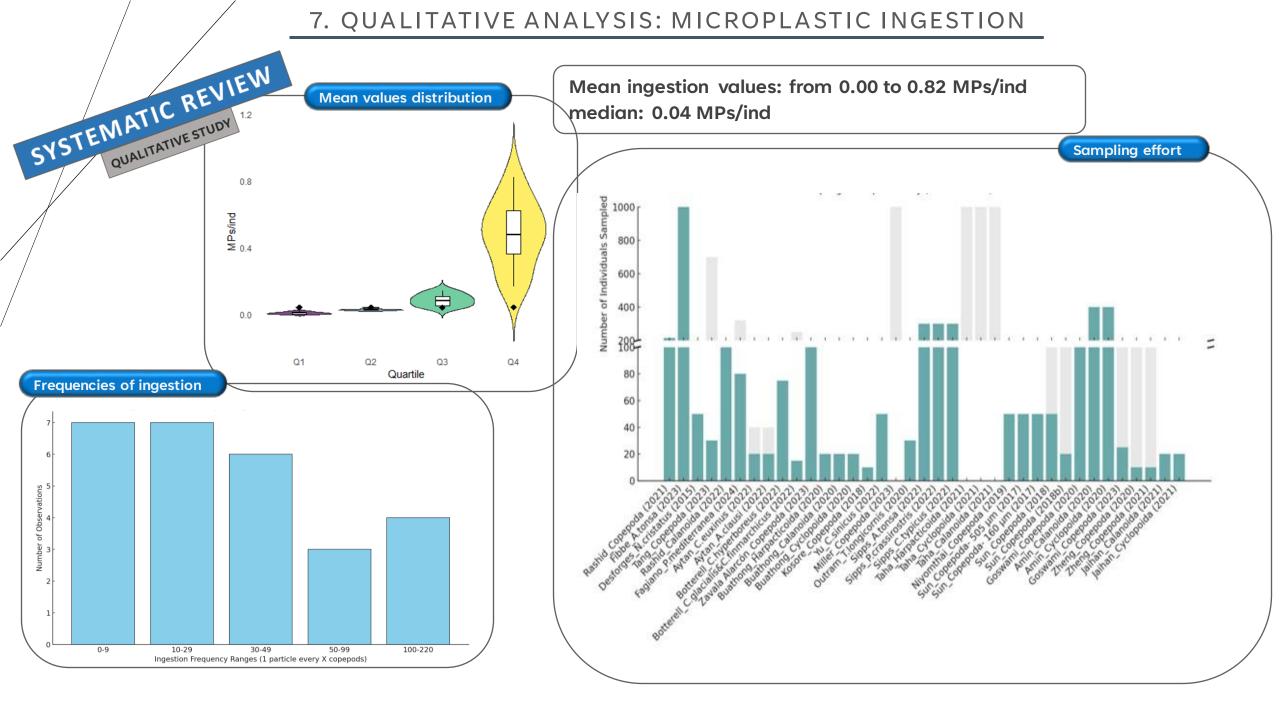

To provide a framework for data analysis and reporting on microplastic pollution and copepods.

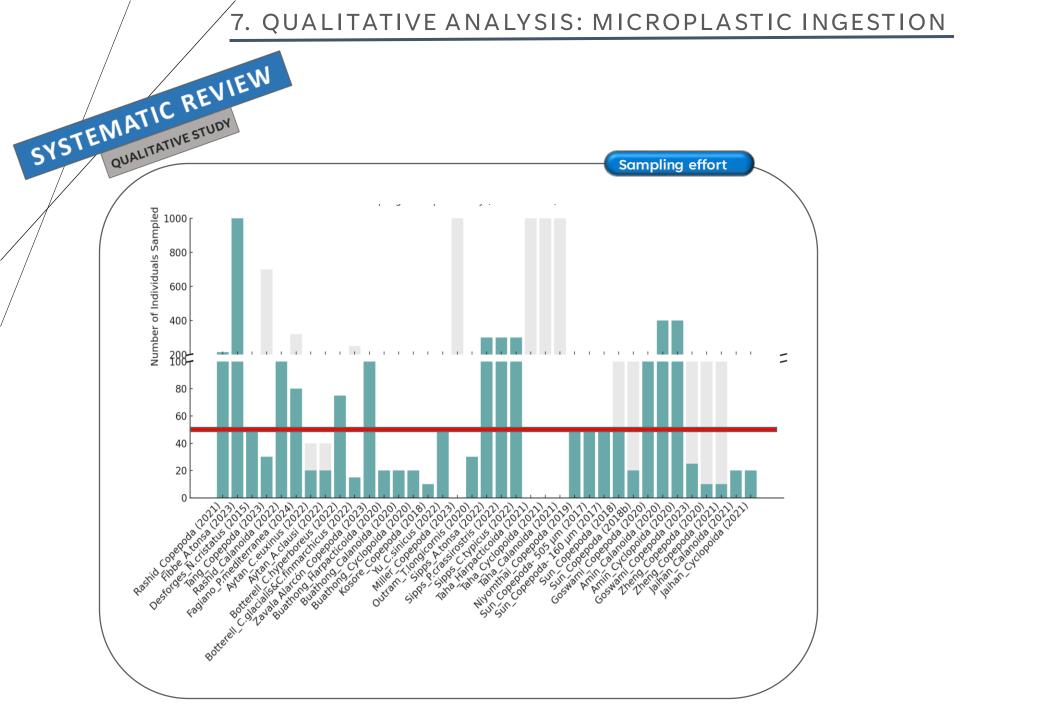

#### 5. SYSTEMATIC REVIEW ANALYSIS OF EXPERIMENTAL STUDY - WORKFLOW

(Elaboration based on data published by Sun et al., Mar Pollut Bull 2017)

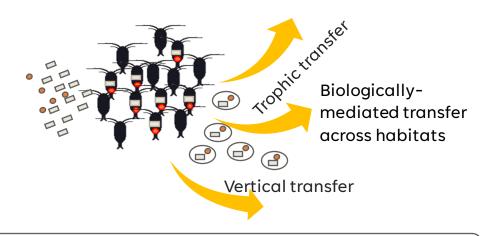

#### 11. CONCLUSION

#### From an ecological perspective

Copepods could represent an extent and transferable biotic revoir of microplastics along with Oceans

#### From a methodological perspective

Abundance and retention are key permeameters to evaluate the interaction between copepods and MPs under field conditions

Retention is correlated to abundance

A sampling effort of more than 100 individuals per survey could be considered prudent to evaluate microplastic retention in copepods.

The size fraction of the copepod community and the bathymetric distribution of the taxa studied, relative to the sampled layer, could affect the assessment of microplastics retained by different copepod taxa and communities.
