# The Inside Passage: part of a vulnerable region with low data coverage

Ocean acidification risk assessment for Alaska's fishery sector

J.T. Mathis<sup>a,b,\*</sup>, S.R. Cooley<sup>c,1,2</sup>, N. Lucey<sup>d</sup>, S. Colt<sup>e</sup>, J. Ekstrom<sup>f</sup>, T. Hurst<sup>g,h</sup>, C. Hauri<sup>i</sup>, W. Evans<sup>a,b</sup>, J.N. Cross<sup>a,b</sup>, R.A. Feely<sup>a</sup>

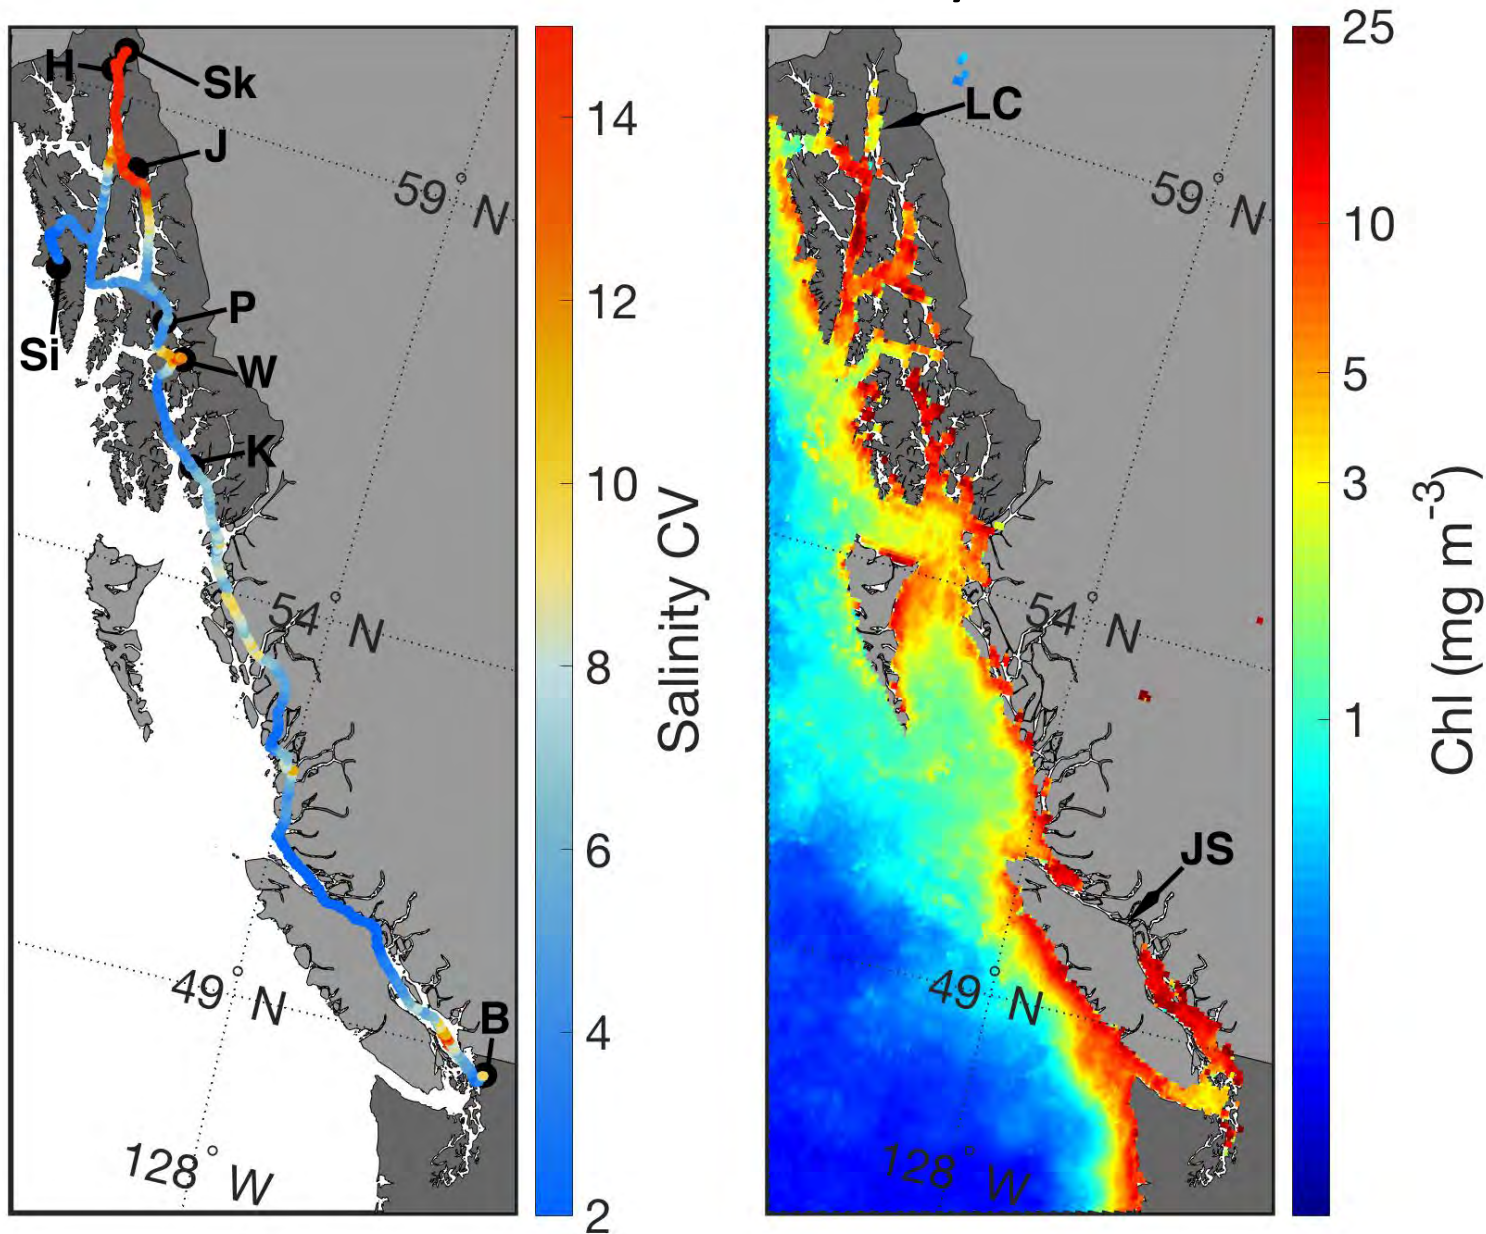

# Alaska Marine Highway Ferry *Columbia* CO<sub>2</sub> system in 2017

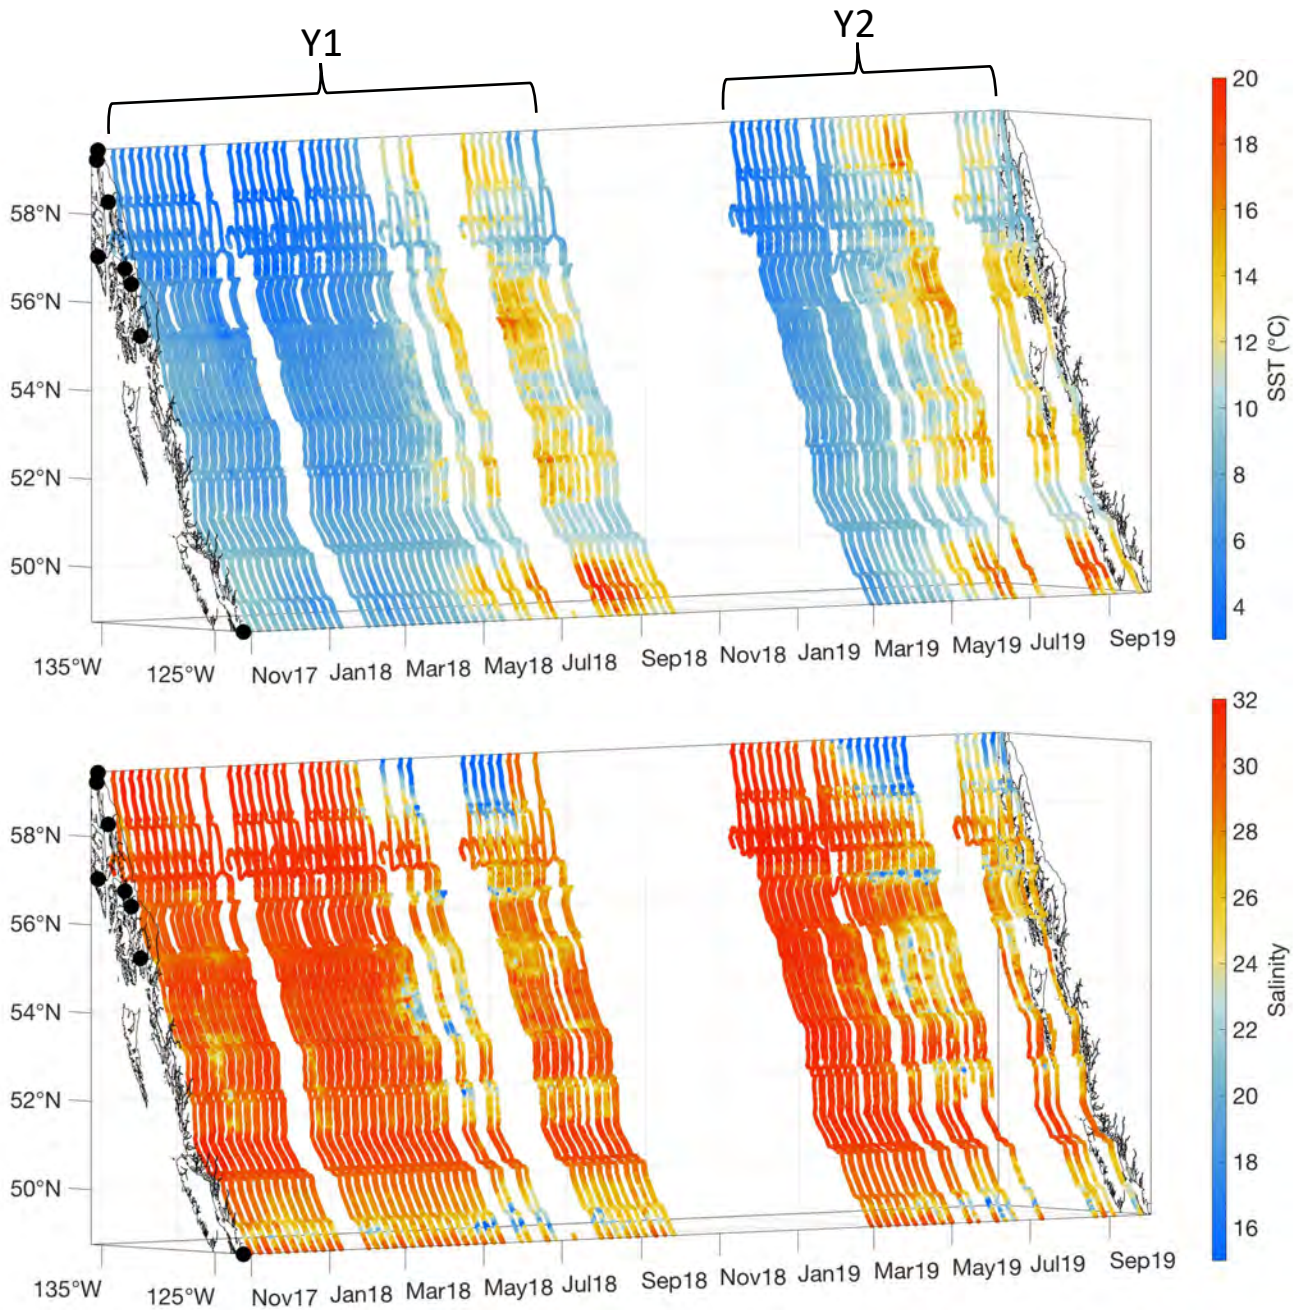

# Addition of MBARI BioGeoChemical SURface MOnitoring (BGC-SUMO) system in 2019

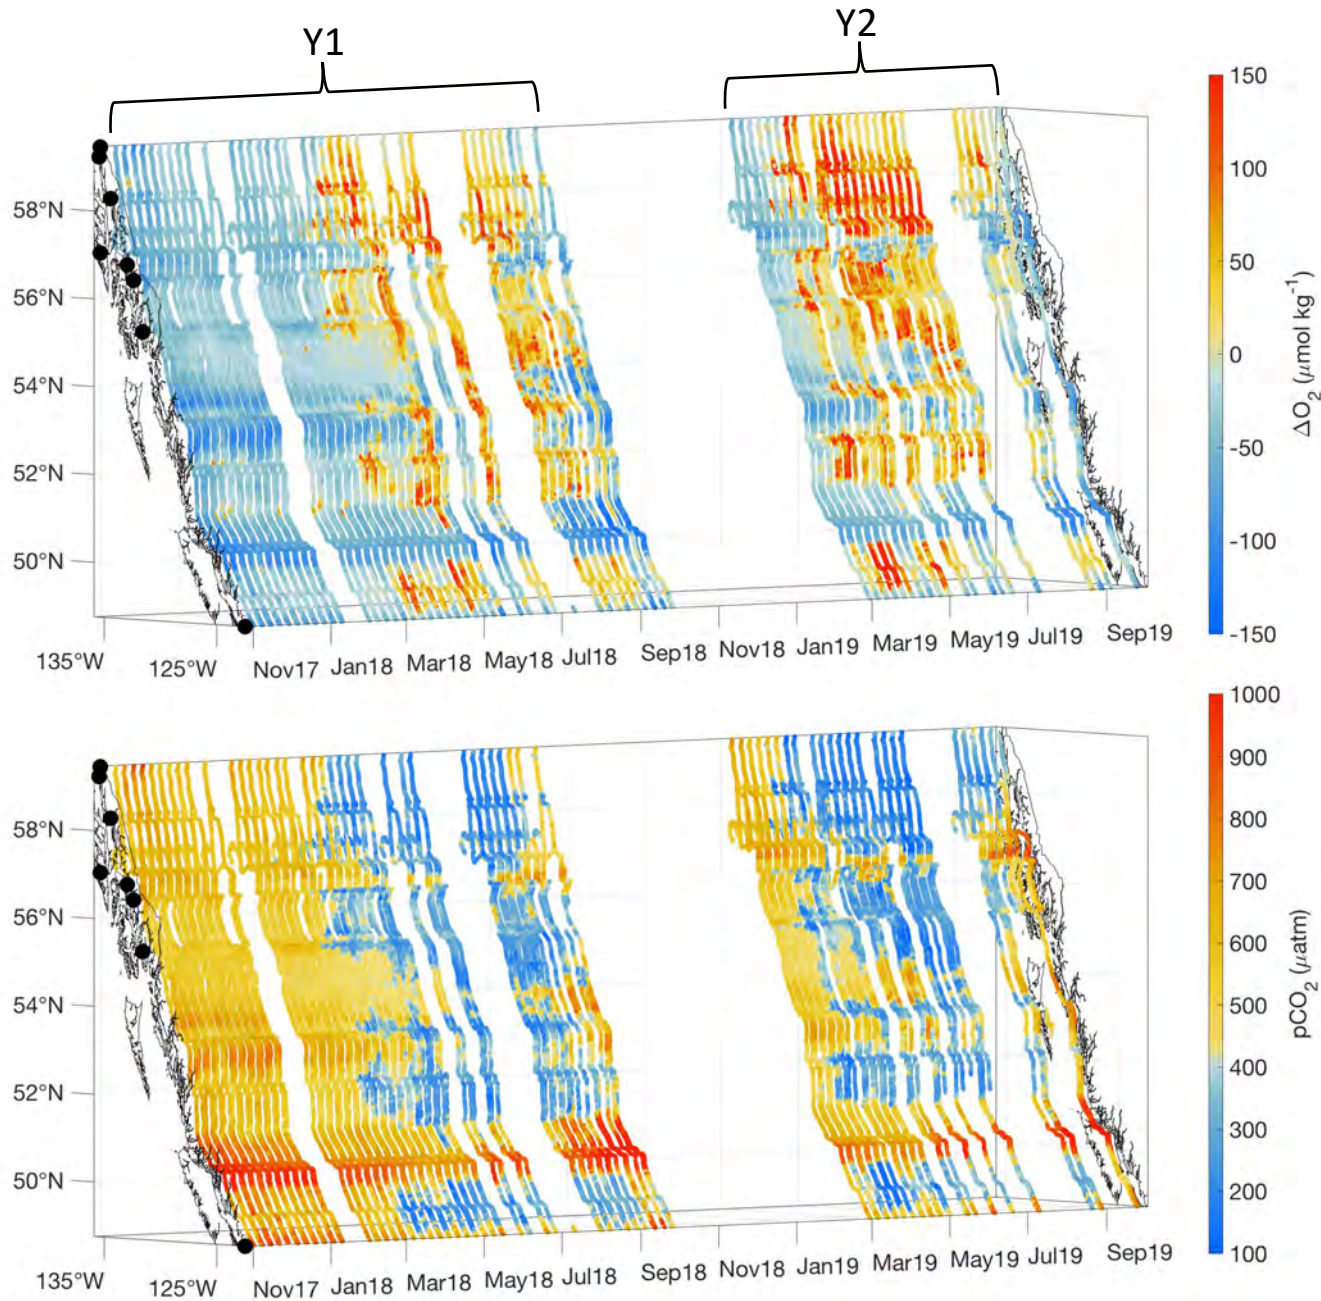

# The longest instrumented ferry run in North America ~1300 km 1-way

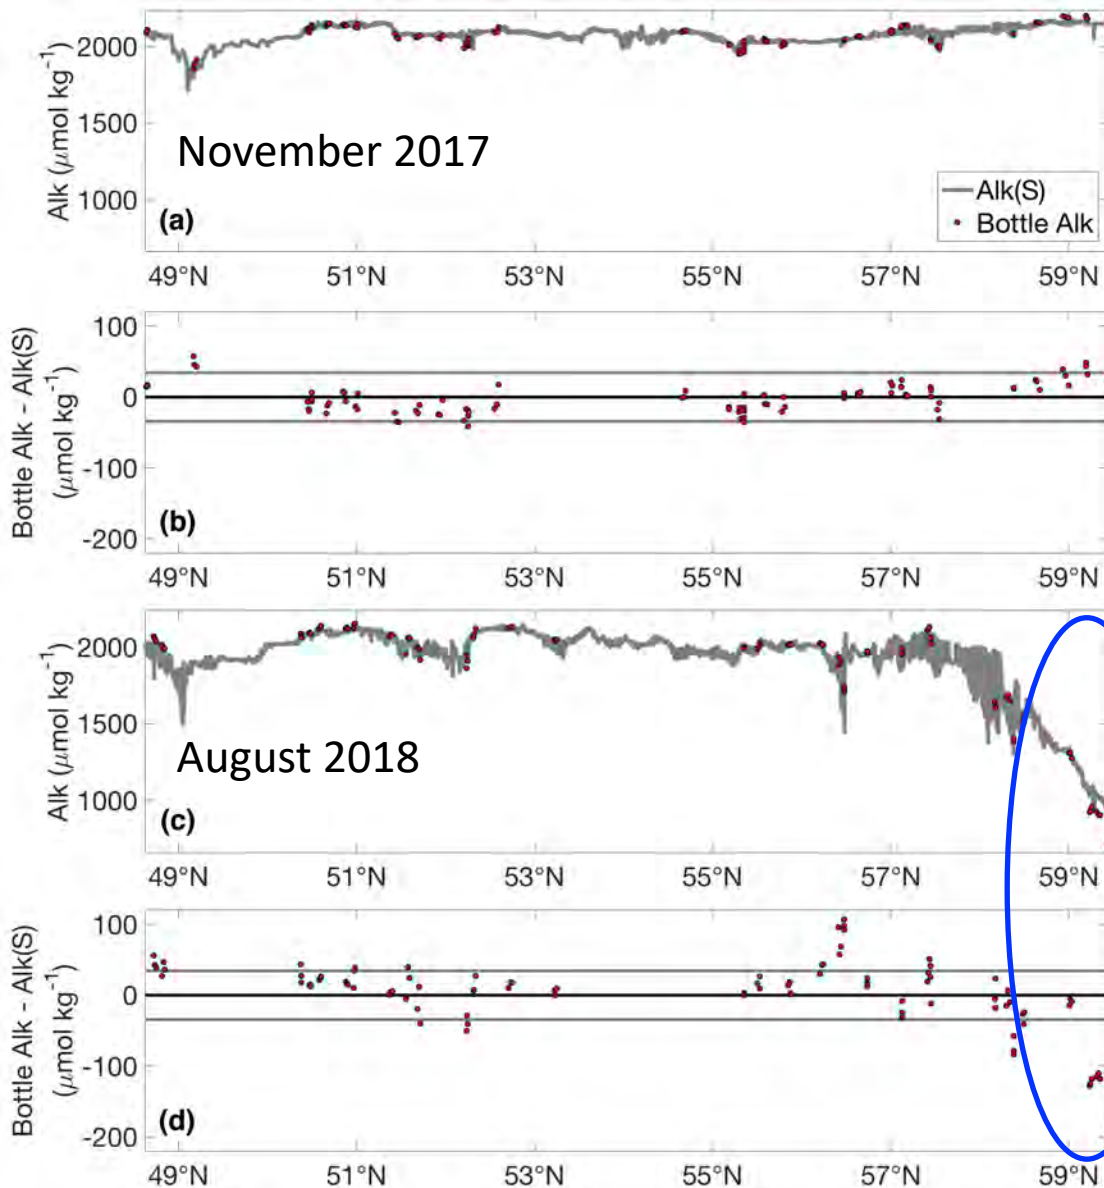

# Seasonal/Inter-annual patterns in SST & Salinity

# Seasonal/Inter-annual patterns in $O_2$ & $pCO_2$

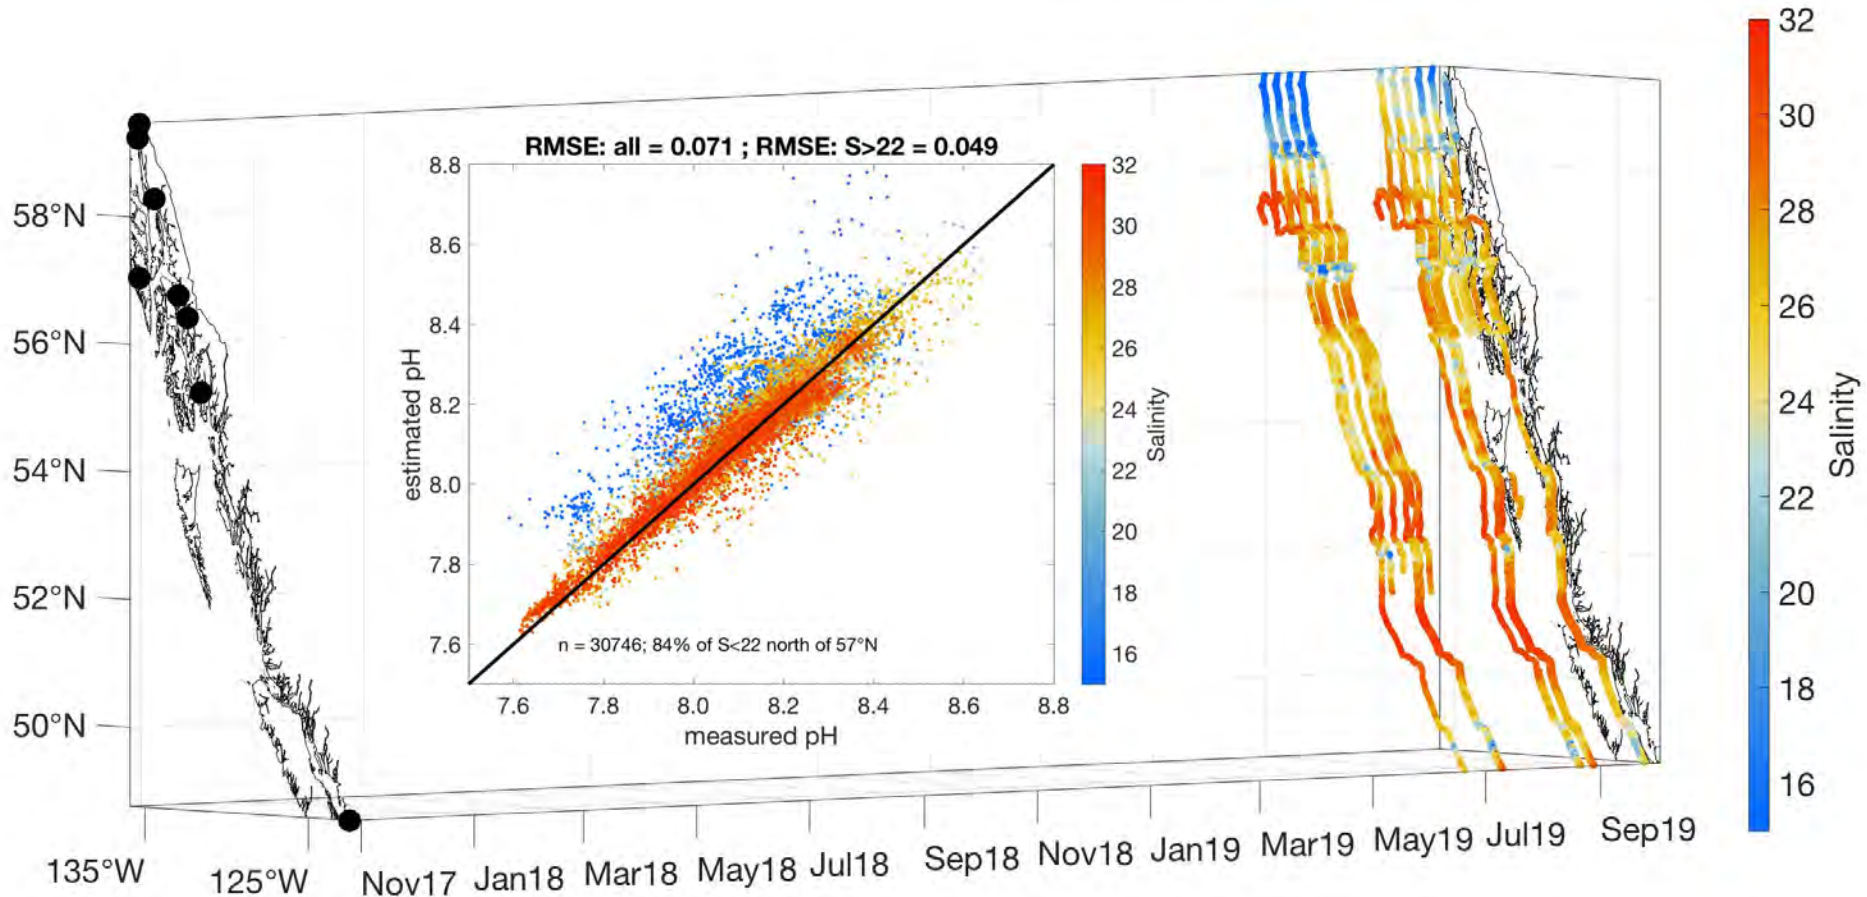

# Discrete pCO<sub>2</sub>/TCO<sub>2</sub> sample validation

Alkalinity poorly estimated in low S water

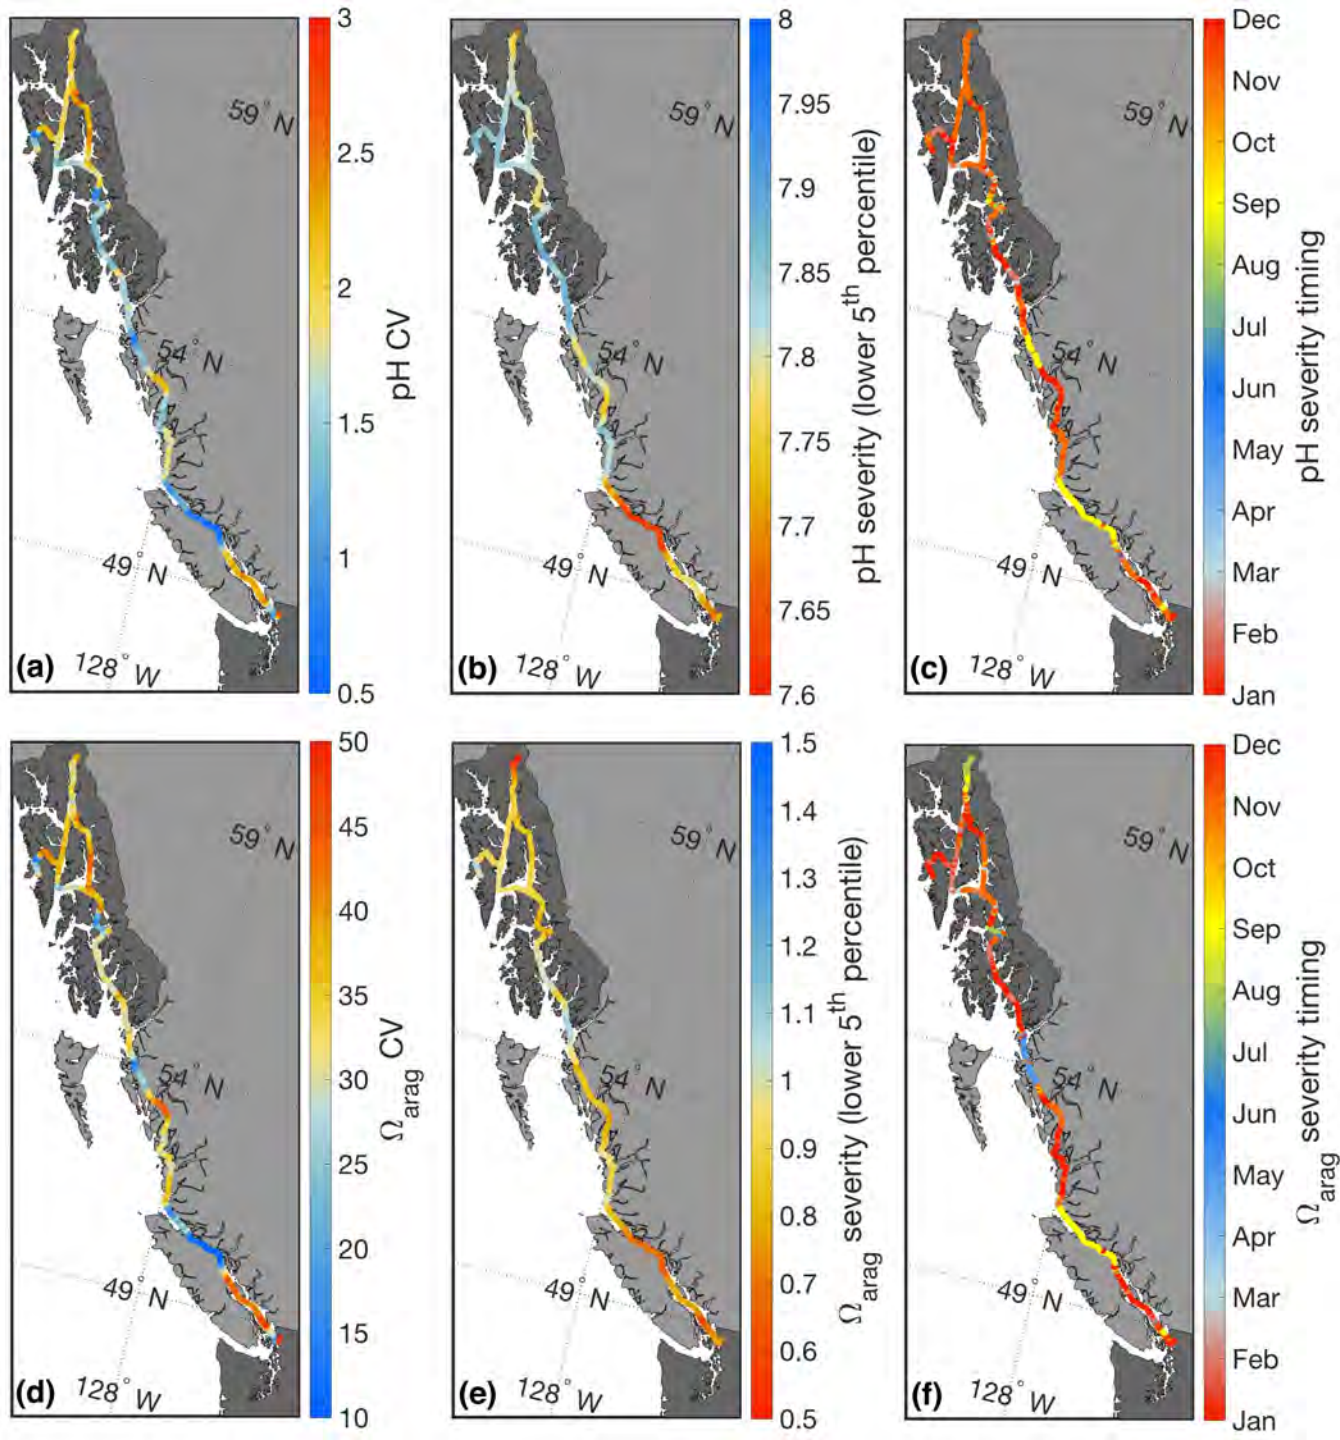

# BGC-SUMO pH comparison

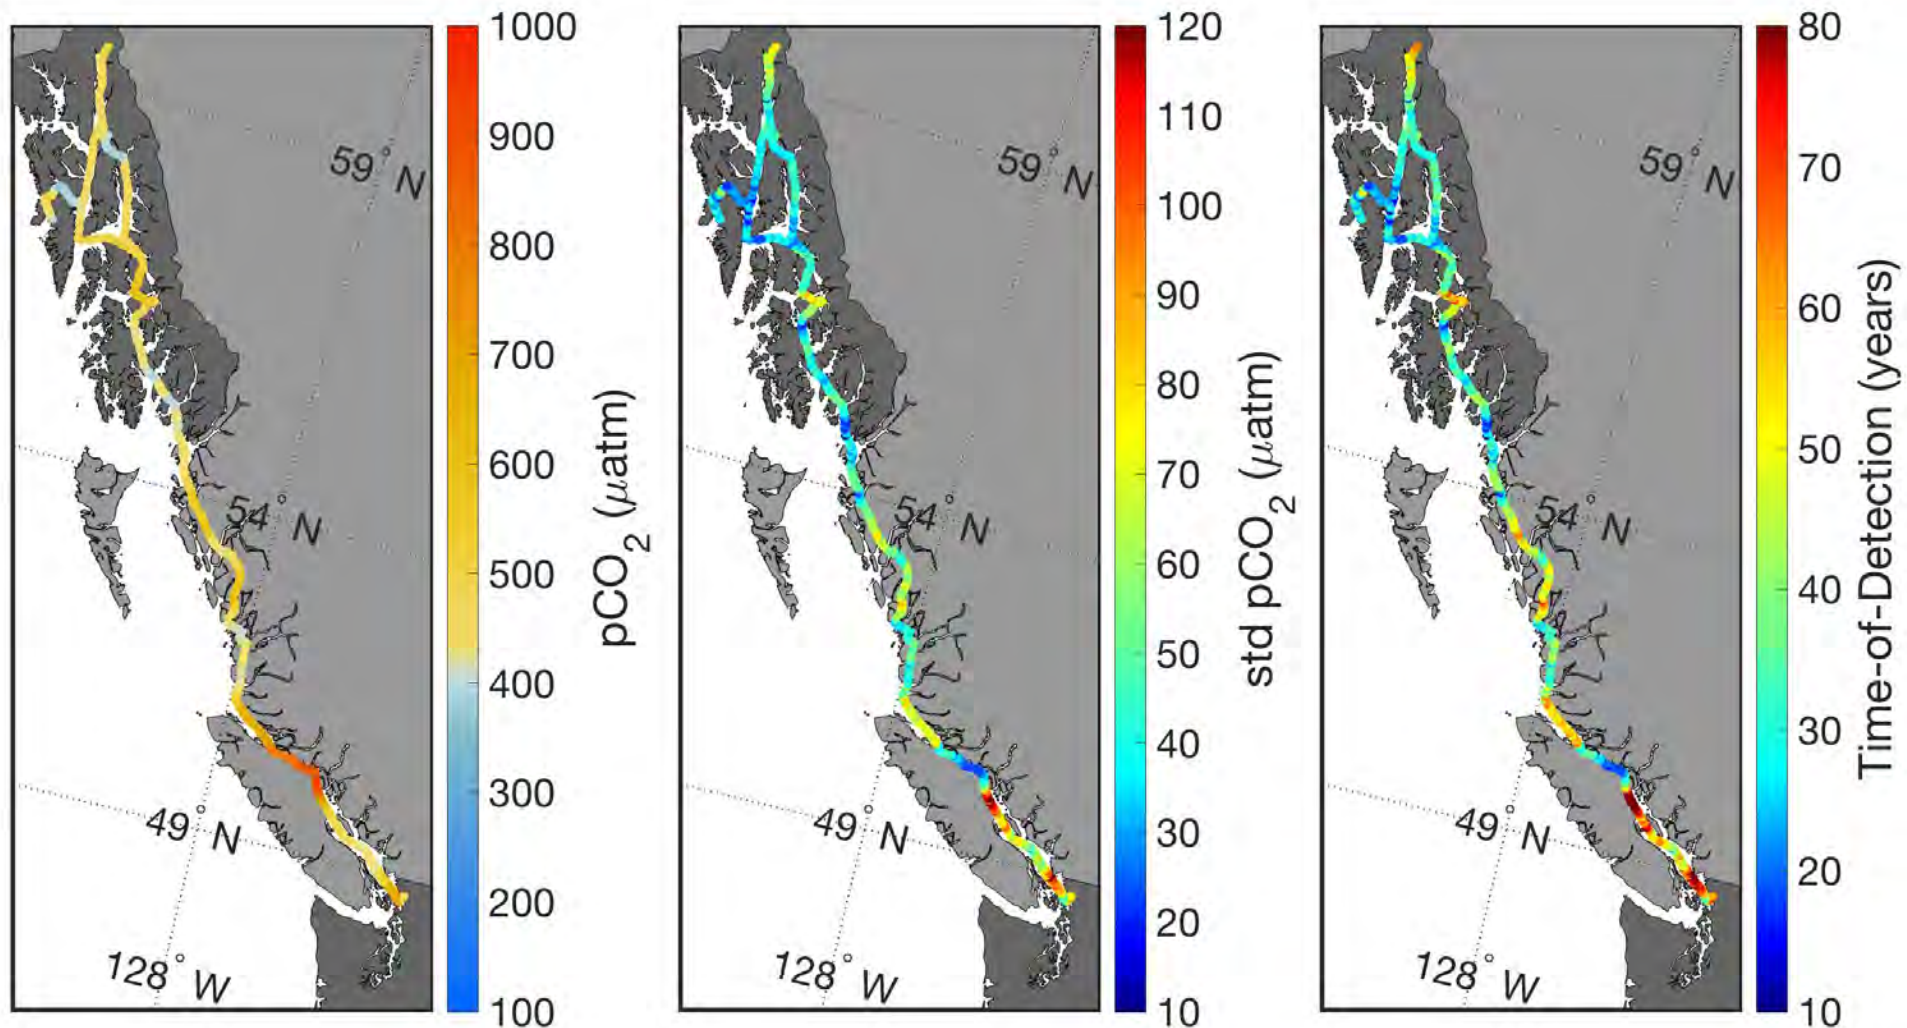

Points to over-estimate in alkalinity in low S water  
Measured pH lower than estimated  
Most evident in summer in Lynn Canal

Variability in  
derived  $\text{CO}_2$   
parameters with  
differences in  
severity and  
timing

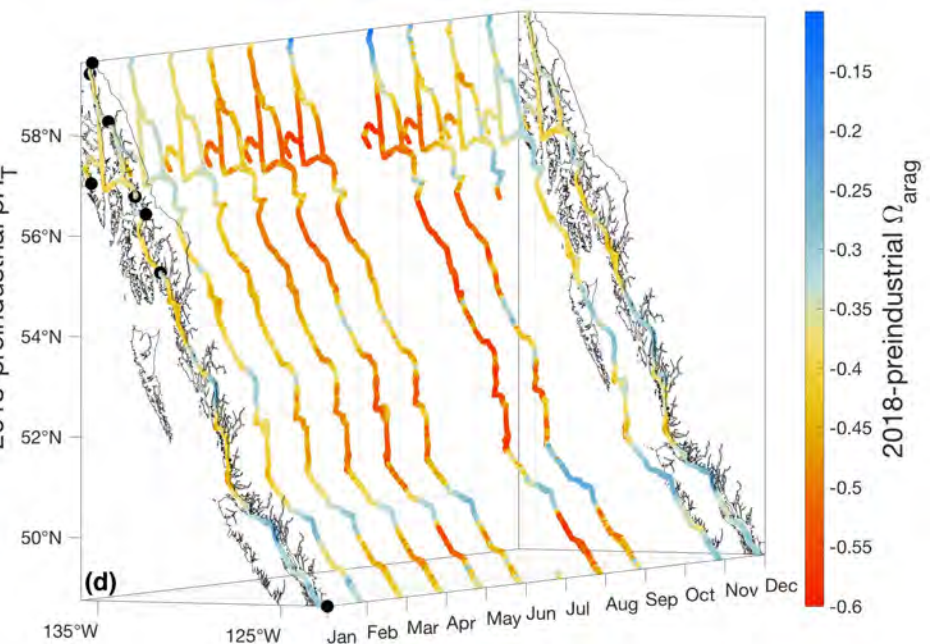

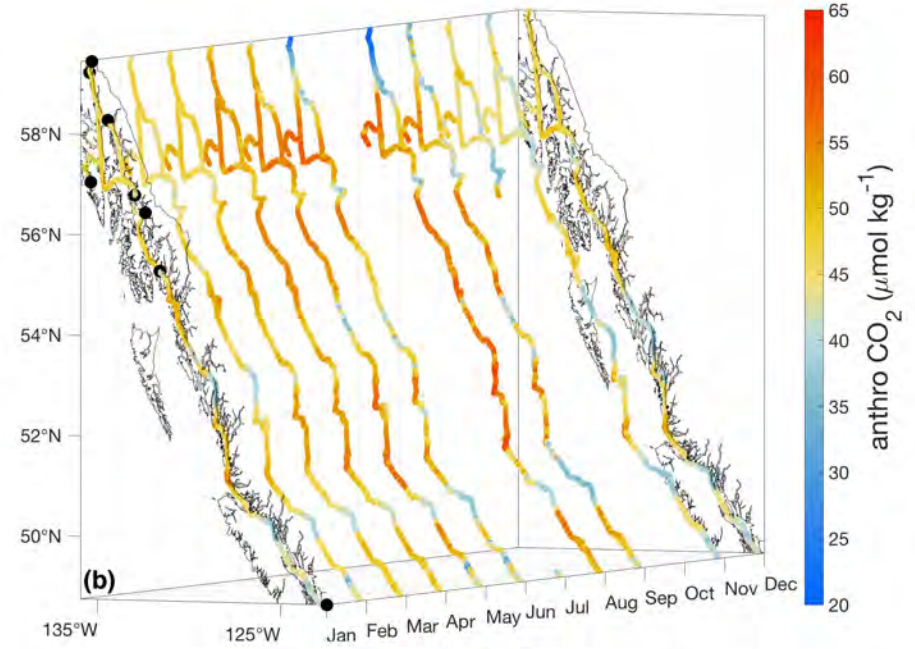

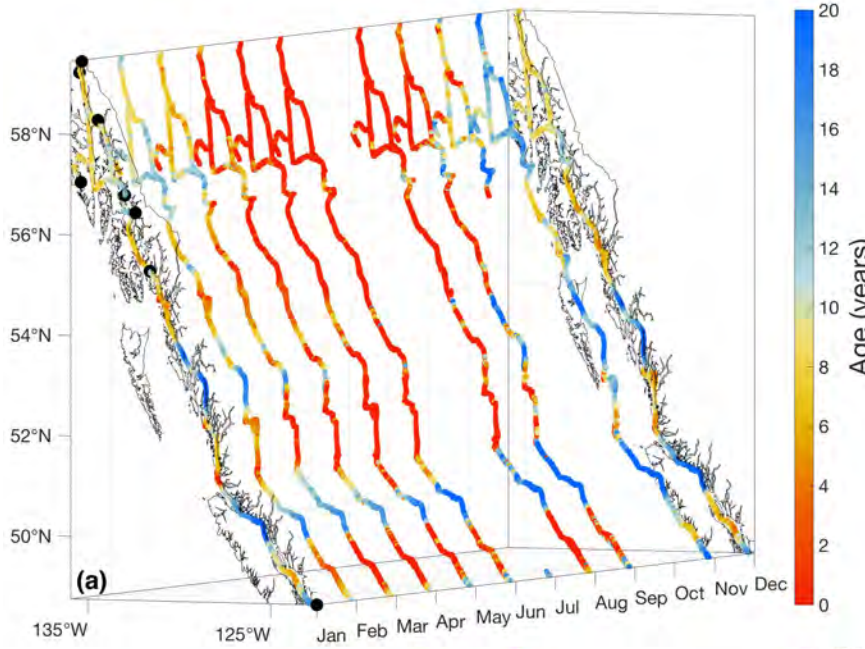

Can we use this information to optimize our observing system?

Without long datasets, must rely on estimating anthropogenic  $\text{CO}_2$  to evaluate change

# Water mass age, anthro- $\text{CO}_2$ , & impacts on $\text{pH} / \Omega_{\text{arag}}$

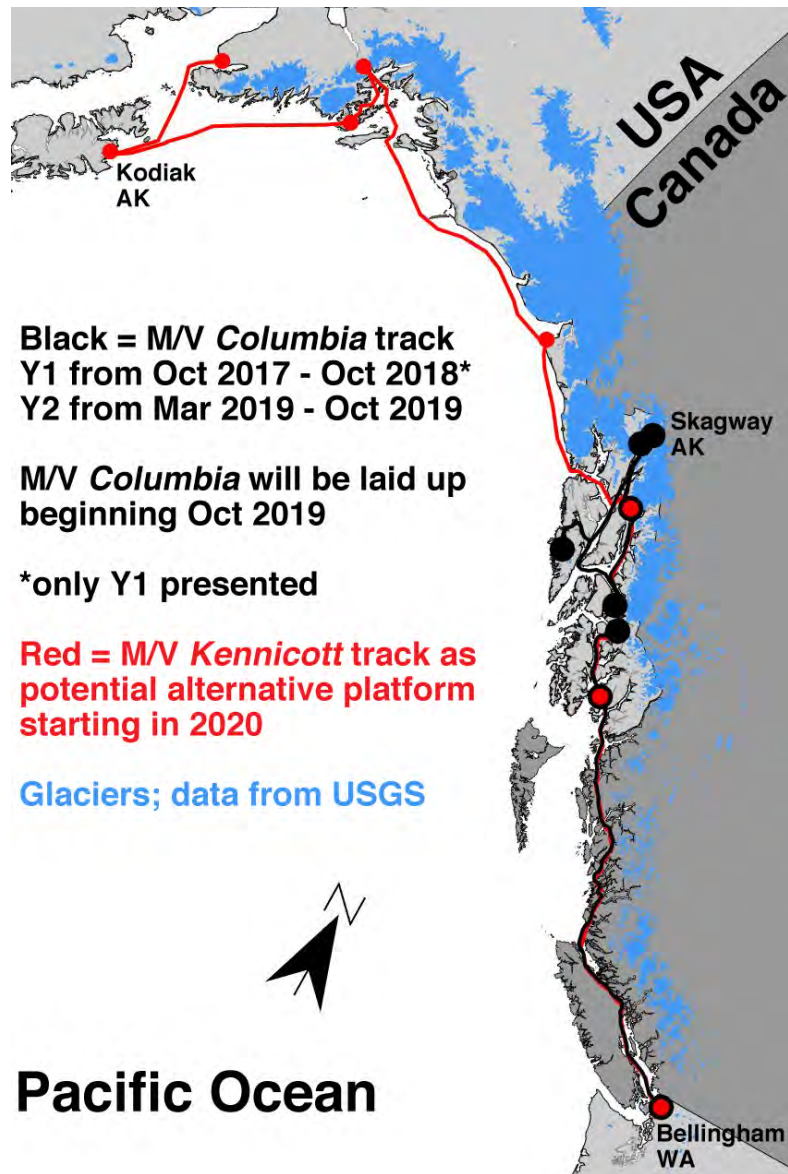

# Closing Remarks

- Resolved  $O_2/pCO_2$  variability for Inside Passage
- Need to improve TA estimation in regions of glacial melt
- Most severe  $pH/\Omega_{arag}$  do not necessarily occur at the same time / location
- Strategize OA observing based on observed  $pCO_2$  variability
- Seasonally dynamic anthro- $CO_2$  with differential between change in  $pH$  and  $\Omega_{arag}$
