

Alaska's Approach to Estimating Recreational Discard Mortality of Pacific Halibut

Sarah Webster and Scott Meyer

Alaska Department of Fish and Game –

Division of Sport Fish

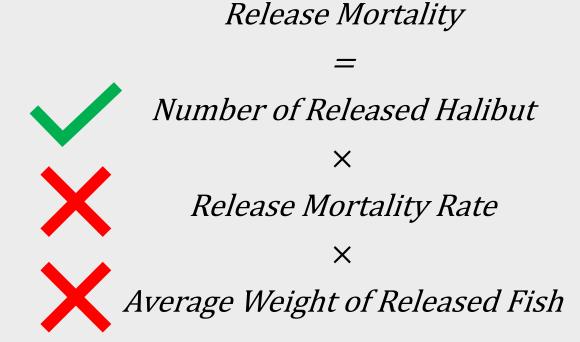

Why estimate release mortality?

- Substantial number of halibut released each year
- All halibut mortality must be accounted for in stock assessment
- Release mortality is included in catch limits

How is release mortality estimated?

Statewide Harvest Survey

Creel Sampling

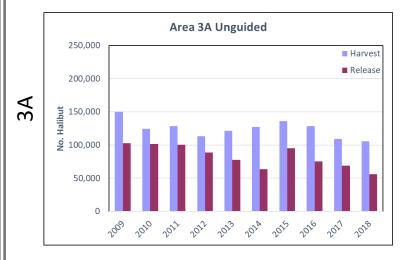

Number of Released Halibut

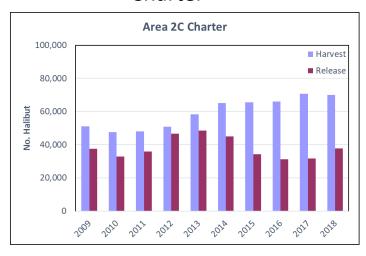

Number of Halibut Harvested and Released

From Statewide Harvest Survey Unguided

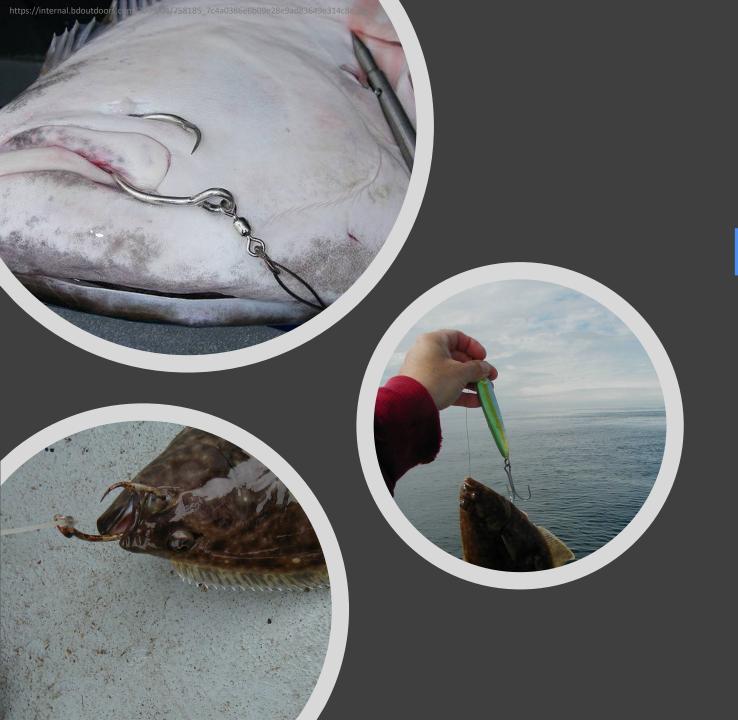

From Saltwater Guide Logbook Charter

Release Mortality Rate

- Type of hook
- Hooking location
- Use of bait
- Length of time on hook
- Handling time
- Temperature
- Release method
- Species-specific physiology
- Fish size

Gear Specifications

- Hook type varies by target
- Circle Hooks
 - Most common halibut gear
 - Usually corner of mouth
- Other Hooks (J-hooks, Treble, Jigs)
 - More common for salmon, rockfish fishing
 - Can hook deeper or in other locations

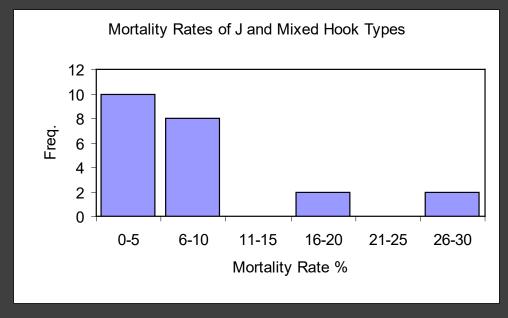

Assumed Mortality Rate by Hook Type

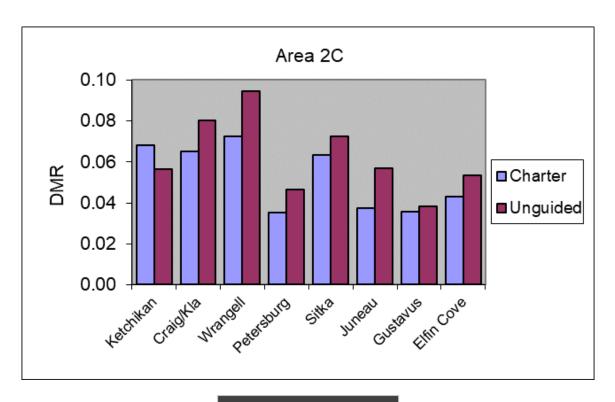

• Circle – 3.5%

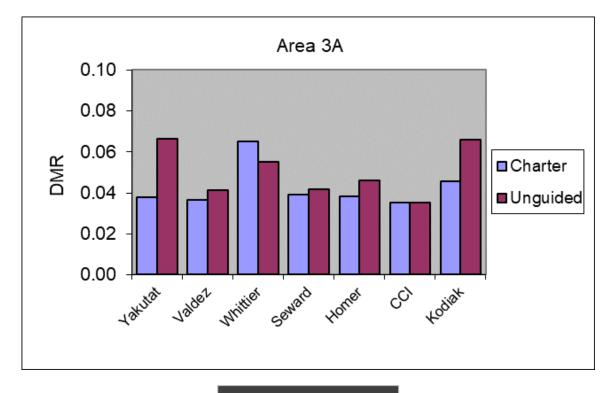

- Peltonen (1969)
 - Excellent condition: 2 5% release mortality rate
 - Longline caught, J-hooks, held in pens
- 3.5% assumed for sport-released
 - Fought for short time, less exhaustion
 - Generally small fish, released quickly

• Other –10%

Release Mortality Rates Vary by Port and Sector

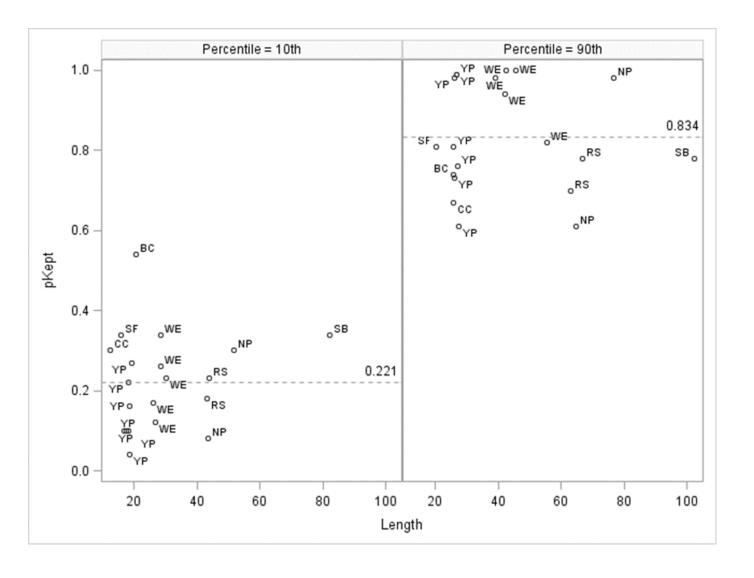

Unguided \rightarrow 7% Charter \rightarrow 6% Unguided → 6% Charter → 5%

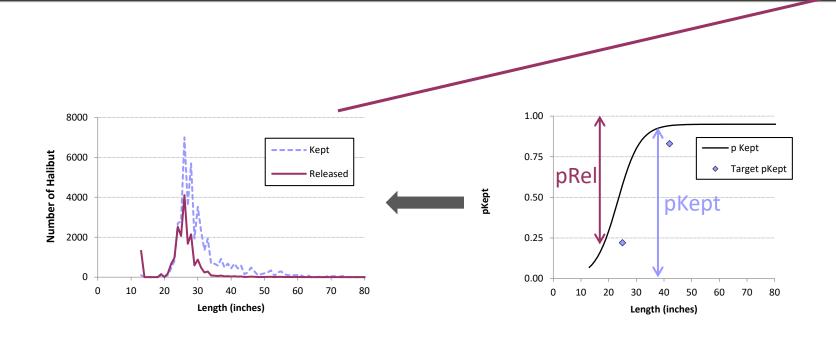

Average Weight of Released Fish

- Currently no sampling of released fish
 - Sampling would be extremely expensive
 - High variability in sizes of discards among ports, vessels, sectors
- Average size of released fish is modeled using retention probabilities

Proportion of Fish Retained in Other Recreational Fisheries

Release Mortality = Number of Released Halibut × Release Mortality Rate × Average Weight of Released Fish

$$p_L = \frac{p_{\infty}}{1 + \exp(-\kappa(L - \gamma))}$$

 p_{∞} = the theoretical maximum retention probability ($p_{\infty} \le 1$),

 κ = a slope parameter, and

length to the nearest inch (for compatibility with size limits), and

= the length at the inflection point of the curve.

Estimating Size of Released Halibut

Additional Limitations in 2C Charter Sector

- Creel interviews provide data on release size categories
- Under protected slot:
 - Use logistic model
- Within protected slot:
 - Size limits in place since 2010
 - Use 2010 data to estimate release length
- Over protected slot:
 - Use 2010 data to estimate release length

Estimation of Release Mortality in Recreational Halibut Fishery

- Number of Released Fish
 - Statewide Harvest Survey
 - Guide Logbook
 - Creel Sampling
- Release Mortality Rate
 - 1969 Peltonen Study, Literature Review
 - Ongiong IPHC Study Claude Dykstra & Josep Planas
- Average Weight of Released Halibut
 - Logistic curve to estimate retention probability by length
 - Observers, Self-reporting, Creel Sampling, New Project Potential
