

An online tool for exploring oceanographic connectivity

Mark Hepburn (software engineer)

Jim Mansbridge (oceanographic analysis)

Phillip England (genetics applications)

<http://www.csiro.com/connie2/>

Outline

- Significance of connectivity within the climate context
- Demonstration of CONNIE 2
- Climate related example
- Future developments and collaborations

Motivation for focusing on connectivity

- Larval transport
 - Recruitment of commercial and conservation species
 - Introductions of exotic species
 - Understanding genetic patterns and biogeography
- Distribution of productivity
 - Phytoplankton
 - Zooplankton
- Dispersal of contaminants
 - Dissolved chemicals
 - Slicks
 - Marine debris

Sensitivities to climate during early life history

Challenges in characterising connectivity

- Exchange rates vary with time
 - ▶ need statistical characterization
- Distribution of sources or sinks may be unknown
 - ▶ need generic characterization
- Role of swimming or settling behaviors
 - ▶ dependent on species, as well as time and space scales

Data layers are not sufficient and there aren't enough friendly oceanographic modelers to go around!

CONNectivity InterfacE – CONNIE 2

CONNIE 2 integrates:

- oceanographic transport
- biological behaviours
- environmental conditions (soon)

within a user-friendly online tool.

Connie2

Ocean Currents:

BRAN 2.1 ▾

Release Period (dd/mm);

from: 01/01

to: 10/01

Years:

2003 ▲

2004

2005

2006

2007 ▼

Source: Sink:

Passive:

Behaviours:

Dispersal Time (days): 30

Vertical Level: 105m ▾

Model currents underlying Connie 2

- Potentially any archived dataset of historical currents
- Initial focus on BLUELink Reanalysis (BRAN)
 - Long time series (1993 – 2008)
 - Large region at high resolution
 - Data assimilation
 - Supported and extended into the future
(Australia's operational forecasting model)

Example from a climate hotspot

Ongoing development

- Other ocean model data sets
- Alternative specification of sources/sinks (e.g. polygons) and associated output statistics (e.g. connectivity matrices)
- Integration with other spatial datasets (T, S, Chl-a)
→ exposure following trajectories (e.g. degree days)
- Links to other models (e.g. Atlantis, MARXAN)

Collaboration opportunities

- Areas covered by the existing CONNIE 2
- Linking CONNIE to other model data sets:
 - Great Barrier Reef
 - NW European Seas (POLCOMS)
 - Downscaled climate scenarios?

Thank you
