

The interaction between northern shrimp (*Pandalus* *borealis*) and cod (*Gadus* *morhua*) in inshore and offshore areas off Iceland

Ingibjörg G. Jónsdóttir

Marine Research Institute,
Iceland

Outline

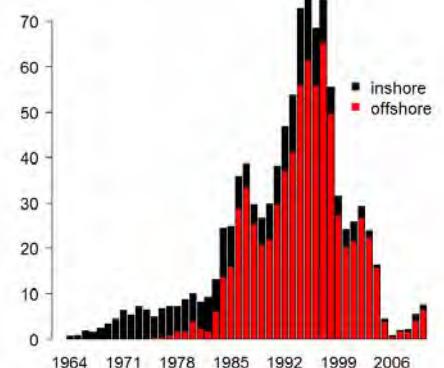

- Introduction
- Inshore
 - Area + survey
 - Shrimp stock
 - Cod
 - Prey
- Offshore
 - Area + survey
 - Shrimp stock
 - Cod
 - Prey
- Summary and comparison of areas

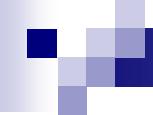

Introduction

- Northern shrimp is
 - targeted by commercial fisheries
 - of great importance as prey in the marine food web
- Predation of cod can have strong effects on the development of shrimp stocks
- The biological interaction between cod and shrimp are poorly understood
- The goal was to compare the feeding ecology of cod, with emphasis on northern shrimp, in two different areas, inshore and offshore shrimp grounds around Iceland

Offshore

Summary

	Inshore	Offshore
Depth	< 155 m	< 700m
Bottom temperature	4.2 – 10.6	-0.8 – 7.4
Mean cod length	23 cm	57 cm
Mean % of empty stomachs	25 %	12 %
Main prey of cod	Shrimp, fishes, krill	Capelin, fishes, Hymenodora, shrimp

Summary

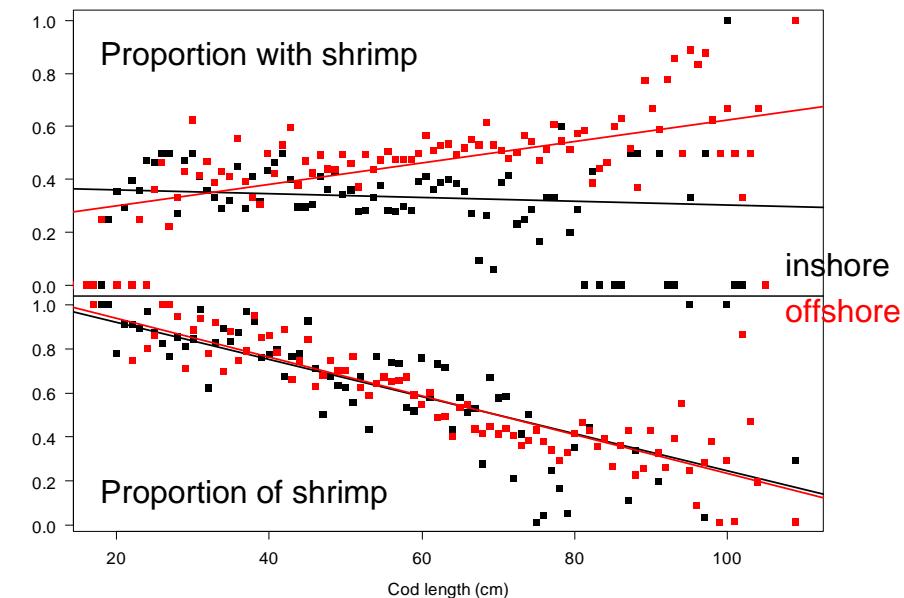

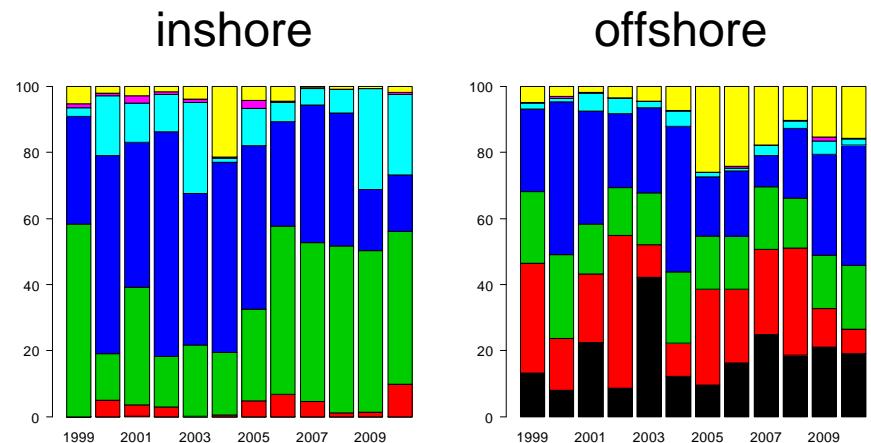

- The proportion cod eating shrimp was higher in the offshore area but has been similar since 2007
- The proportion of shrimp (of the total stomach content weight) was higher in the inshore area.

Summary

- Shrimp was of greater importance in the inshore area
- The proportion of cod feeding on shrimp increased with length in the offshore area but not in the inshore area
- The proportion of shrimp decreased with length in both areas

Thank you for your attention.
