# **Integration of ecological indicators with the network of ocean observations**

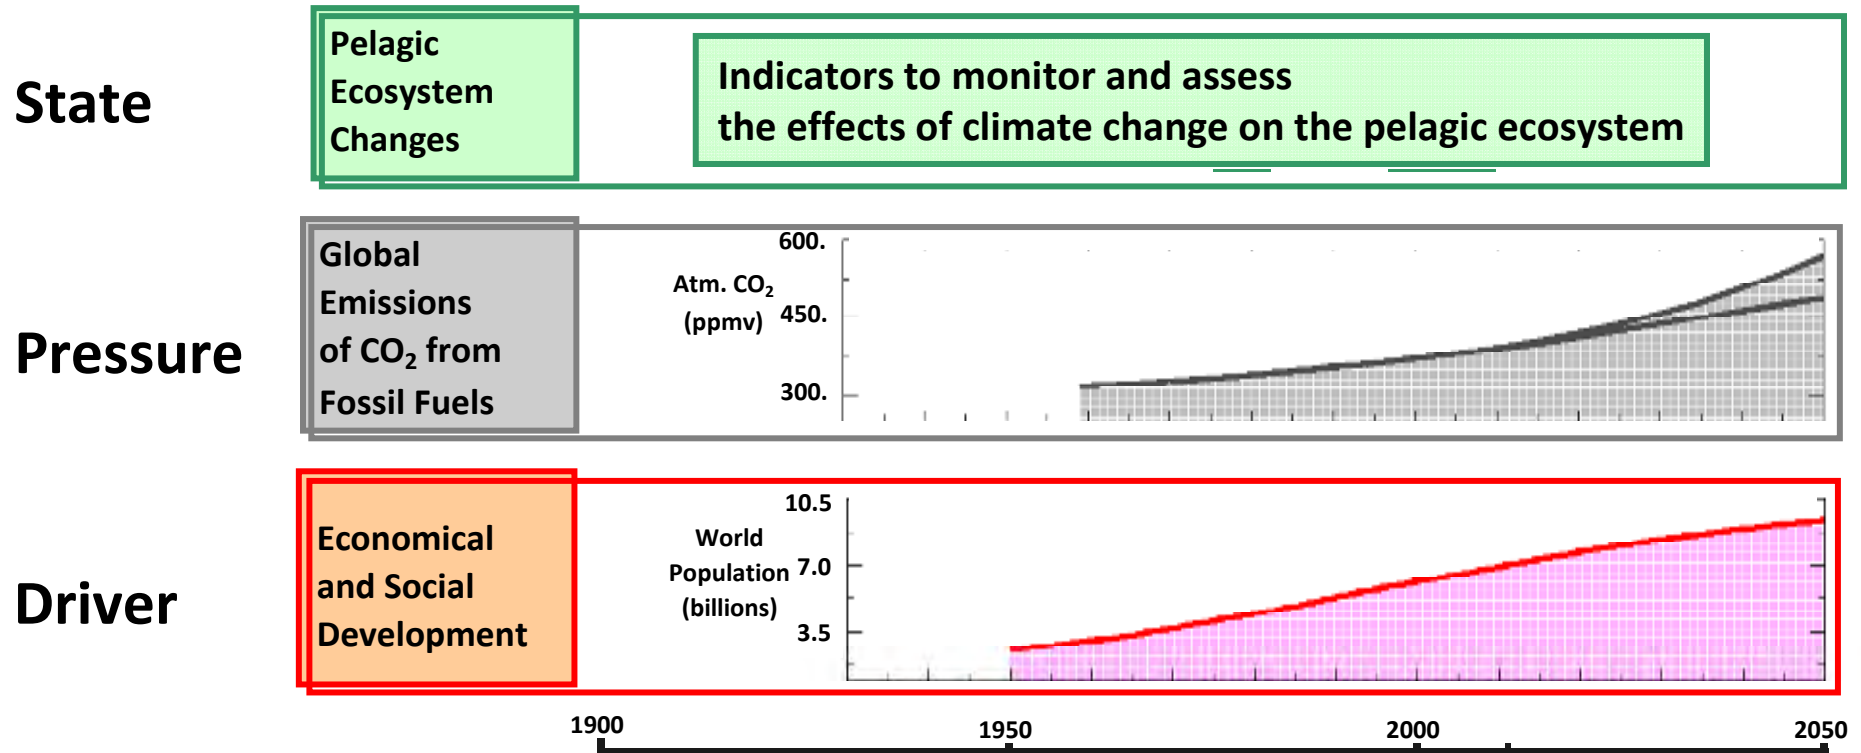

**Marie-Fanny Racault, Trevor Platt, Shubha Sathyendranath,  
Ertugrul Agirbas, Victor Martinez Vicente and John Bruun**

**Effects of Climate Change on the World's Ocean  
Yeosu, May 2012**

## Context

### *Climate Change: chronic environmental hazard*

- spatial and temporal scales involved

## Ecological Indicators:

### **Definition** *(Walz 2000, Heink and Kowarick 2010)*

An indicator in ecology is a component or a measure of relevant phenomena used to depict or evaluate the state of a system

### **Selection**

“Selection will always be a **compromise** among many factors and must be **optimized for the intended purpose**” (Niemi and McDonald, 2004)

**Conceptual frameworks** for indicators selection (Lin et al., 2009):

- . Causal Network – DPSIR
- . Ecological Hierarchy Network

## Ecological Indicators: theory... and practice

### Implementation challenges

- . Practical – coverage, availability
- . Analytical – representativeness, consistency
- . Numerical – variability, trends

---

# **Network of observations**

## Availability of Observations

# Density of Observations

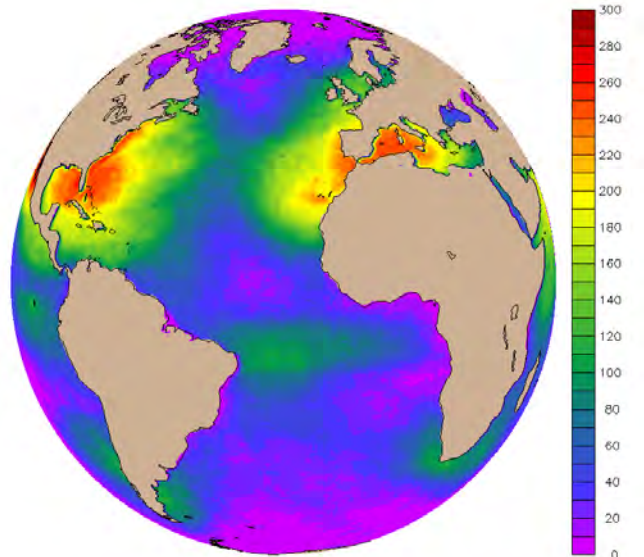

Atlantic Meridional Transect  
1995-2010

Continuous Plankton Recorder  
1958-2010

CZCS Sensor  
1978-1986

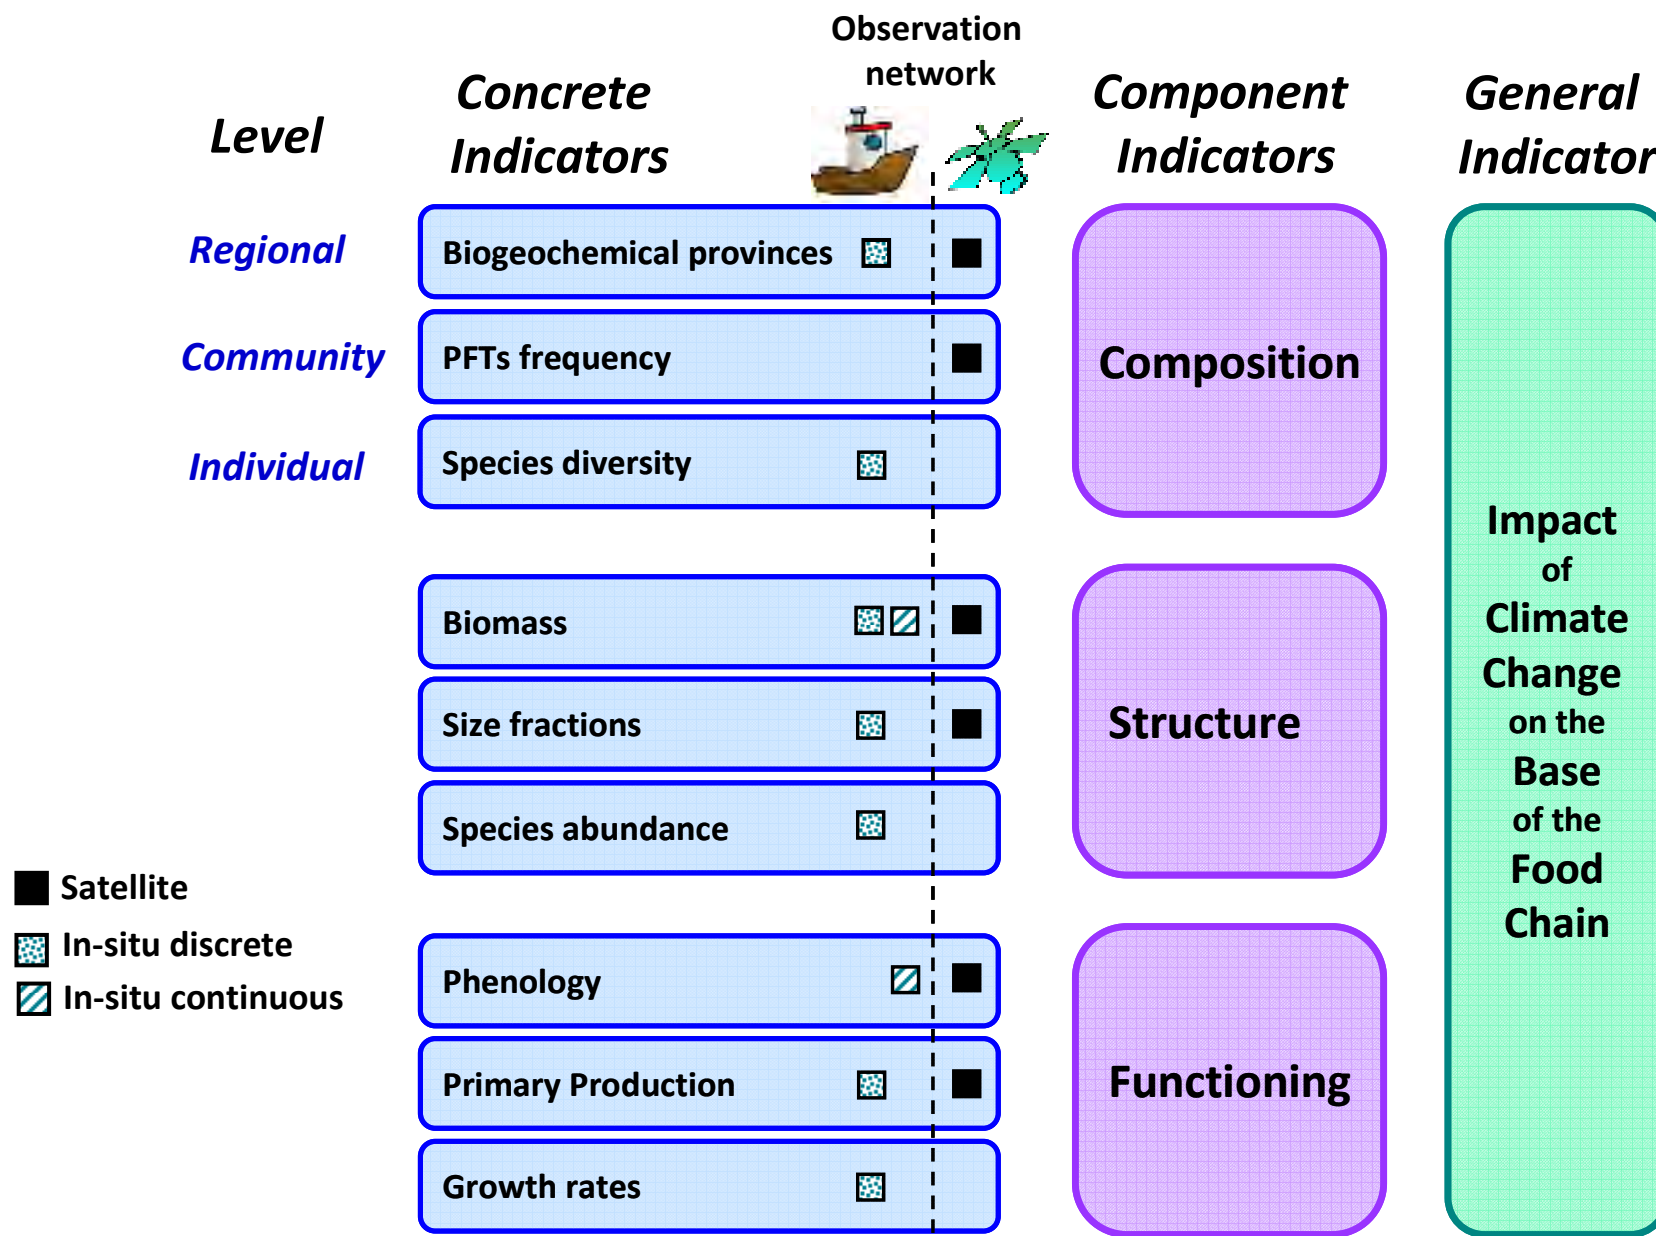

SeaWiFS Sensor  
1997-2010

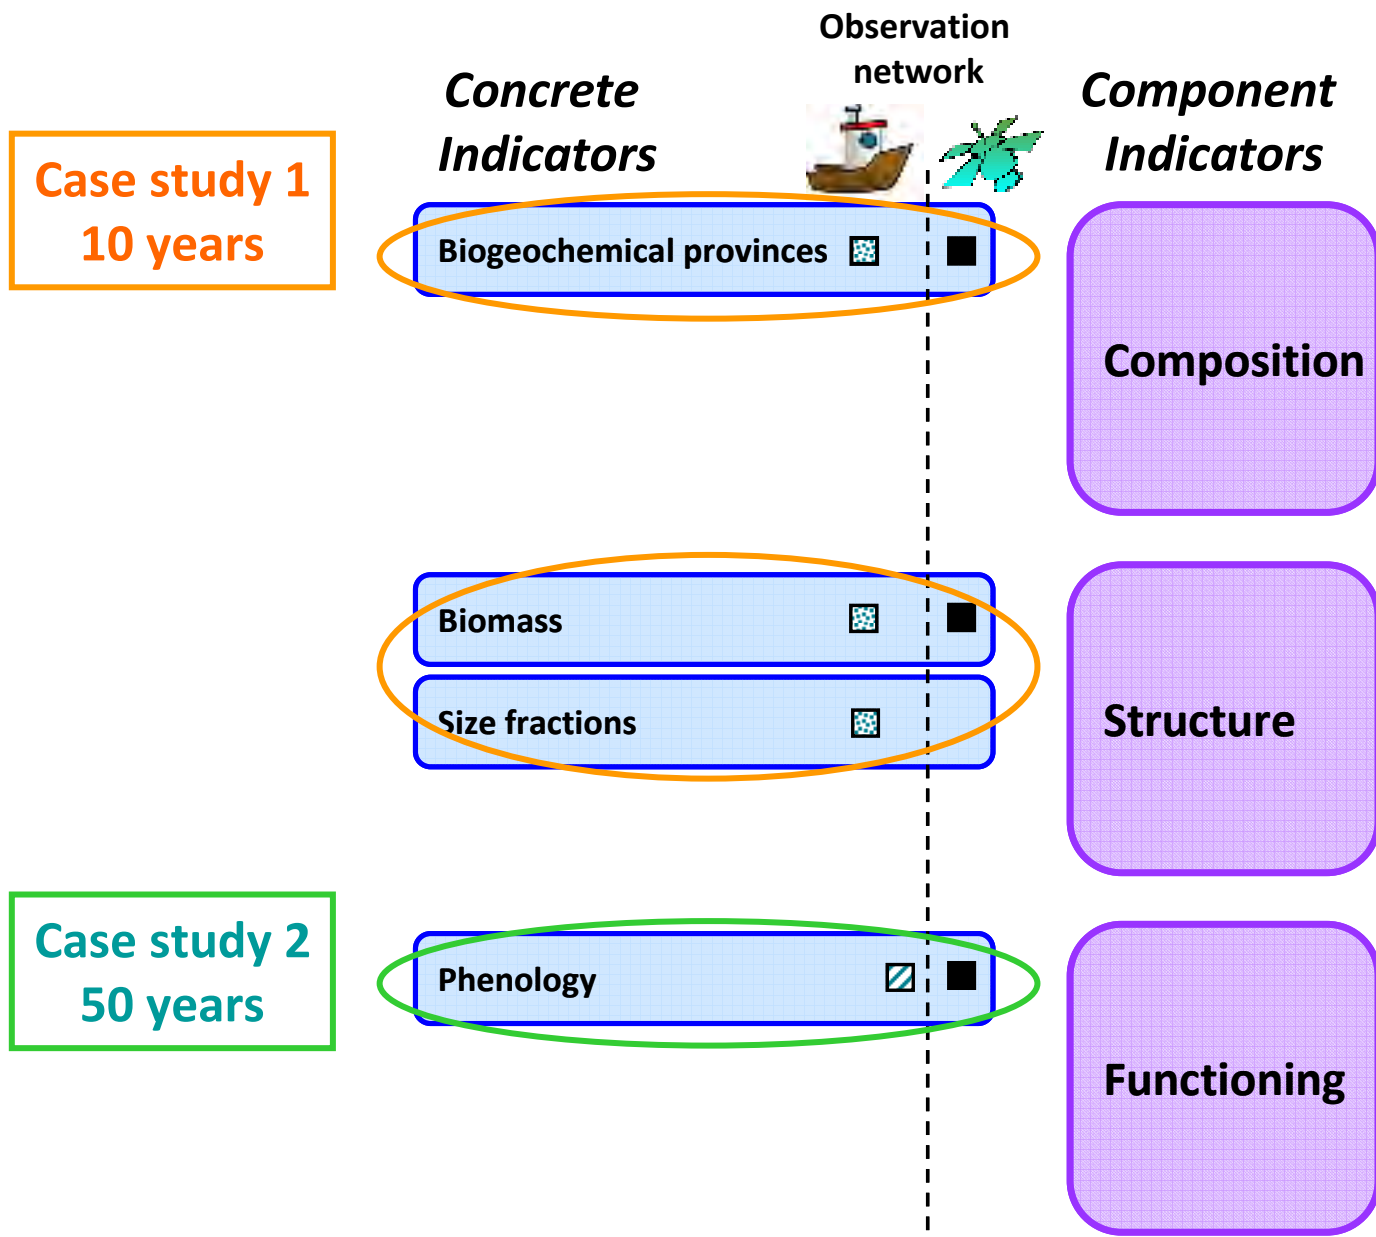

# Indicators of the pelagic ecosystem

# Case-study analysis

---

## ***Case study 1***

# **Trends in phytoplankton biomass and size fractions**

Agirbas et al. *in prep.*

# 1 - Has phytoplankton biomass changed on a decadal scale in the Atlantic?

## Atlantic Meridional Transect (AMT)

### Data selection:

**Vertical selection :** First optical depth

**Temporal selection :** October-November

**Quality evaluation:** Aiken et al., 2009 and Bricaud et al., 2004

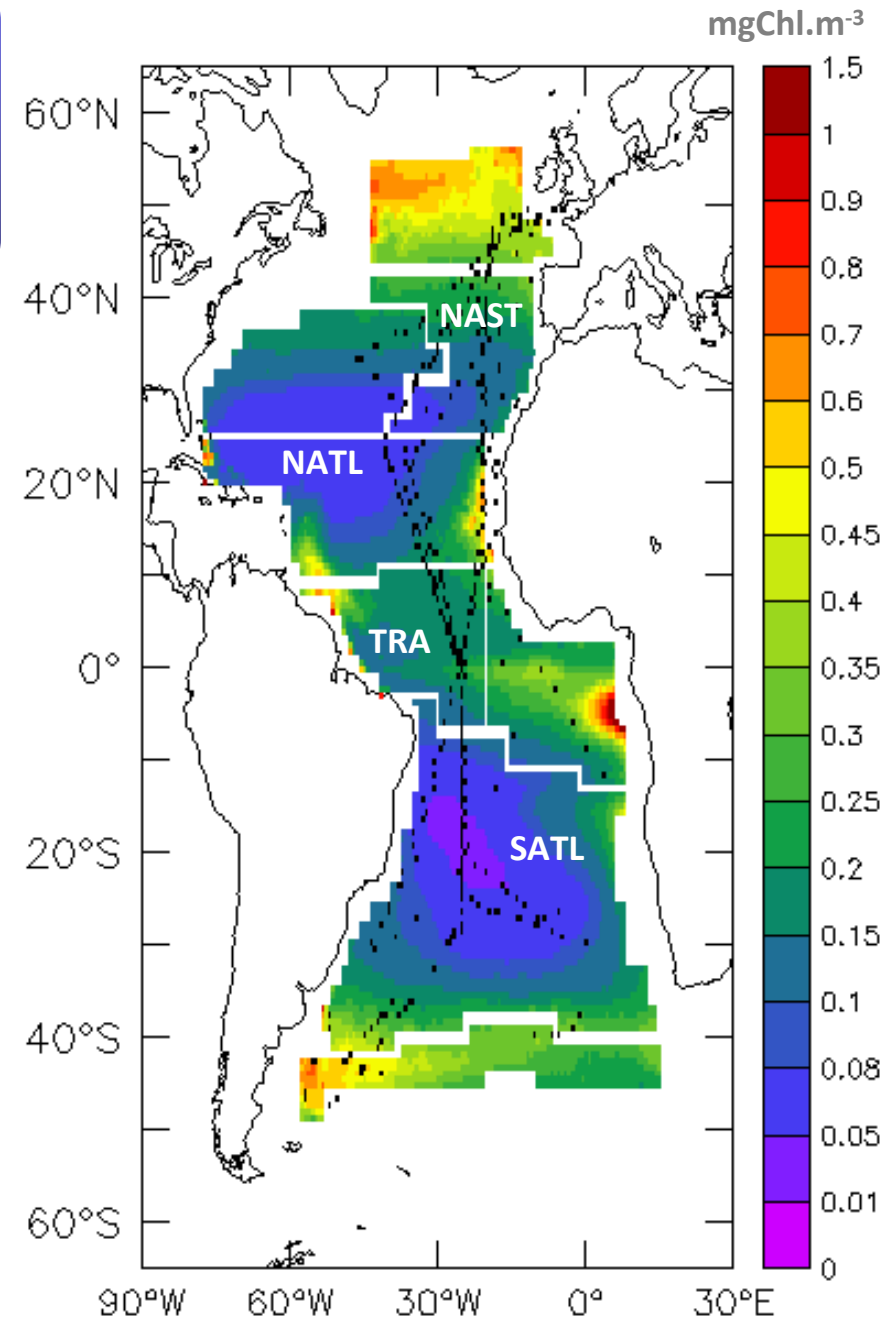

### Provinces sampled

**NAST:** North Atlantic Subtropical Gyre

**NATL:** North Atlantic Gyre

**TRA:** Tropical Atlantic

**SATL:** South Atlantic Gyre

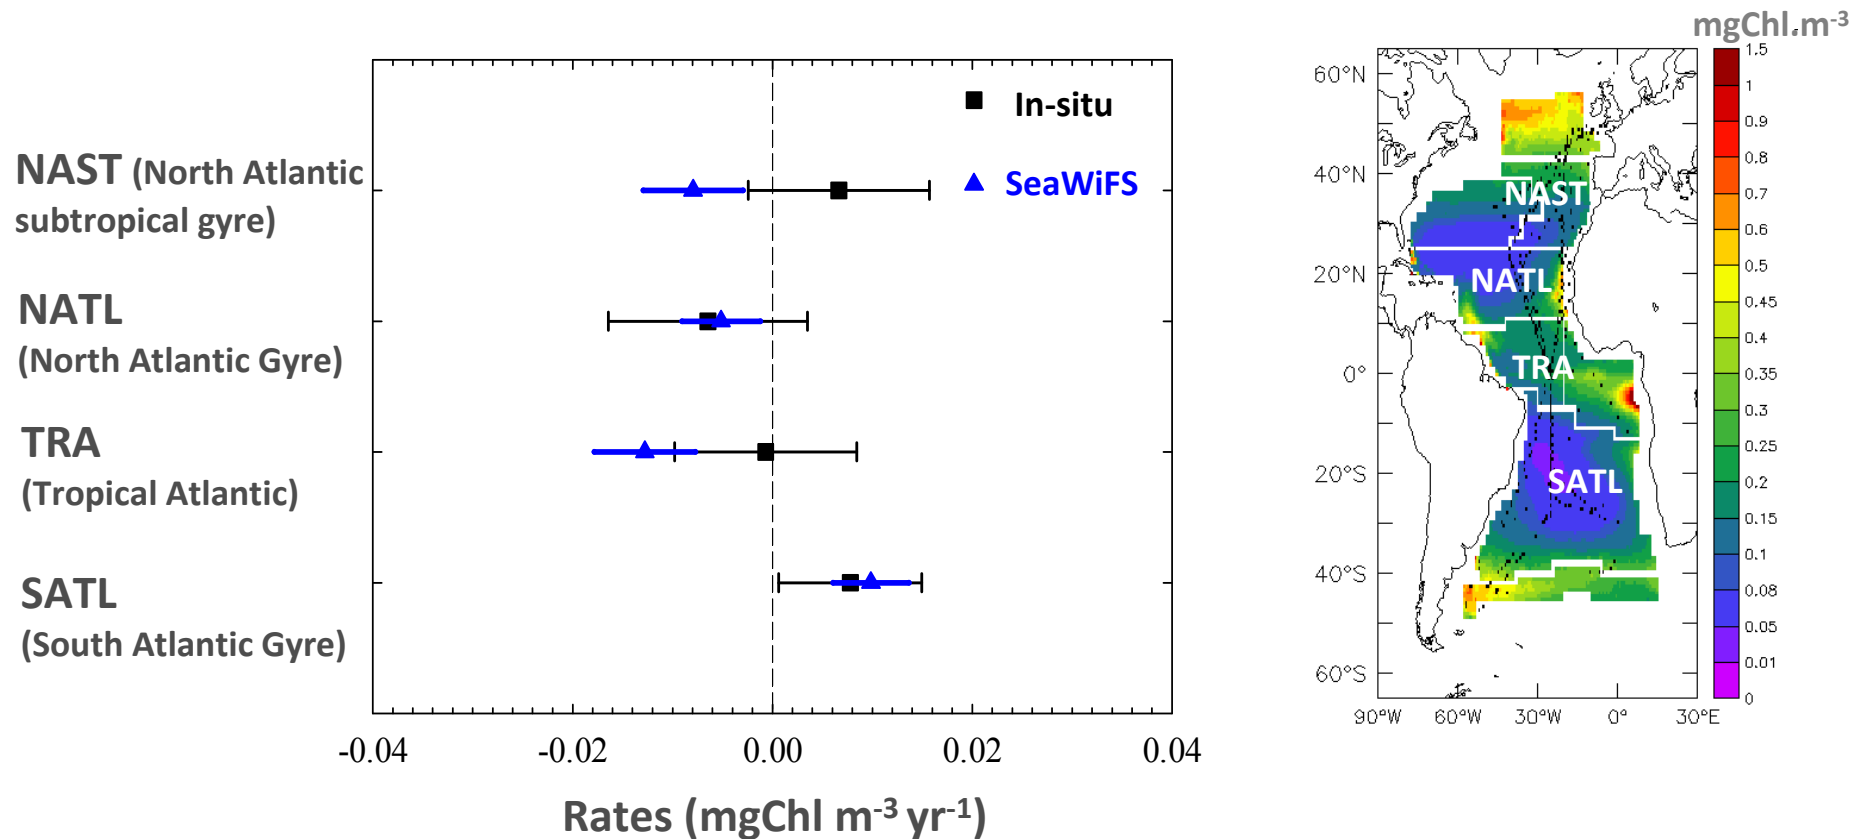

# Representativeness of AMT expeditions

**Satellite data selection:** weekly composites SeaWiFS L3 Chl-a 9 km resolution for the period of the cruises in coincident years averaged over each province.

➡ Trends estimated using **linear regression analysis** on the log-transformed data  
**General Linear Model (GLM)** applied to data for comparisons

# Trends in phyto. biomass over the period 2003-2010 in the Atlantic

No significant

differences in gyres between in-situ and SeaWiFS  
changes in total phyto biomass in the central Atlantic  
differences ( $p < 0.05$ ) in trends among provinces

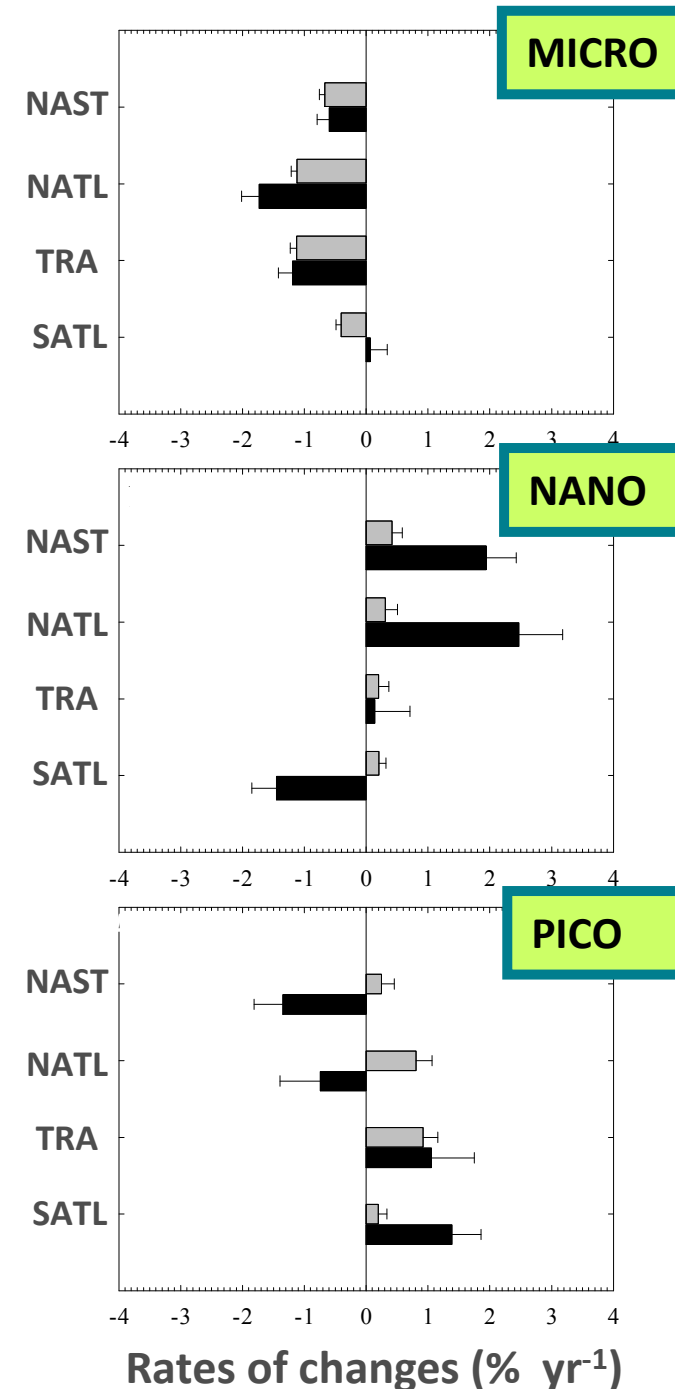

## 2 – Are we observing similar trends in the different phytoplankton size fractions?

■ Uitz *et al* 2006 model  
(using pigments as input)

■ Brewin *et al* 2010 model  
(using Chl-a as input)

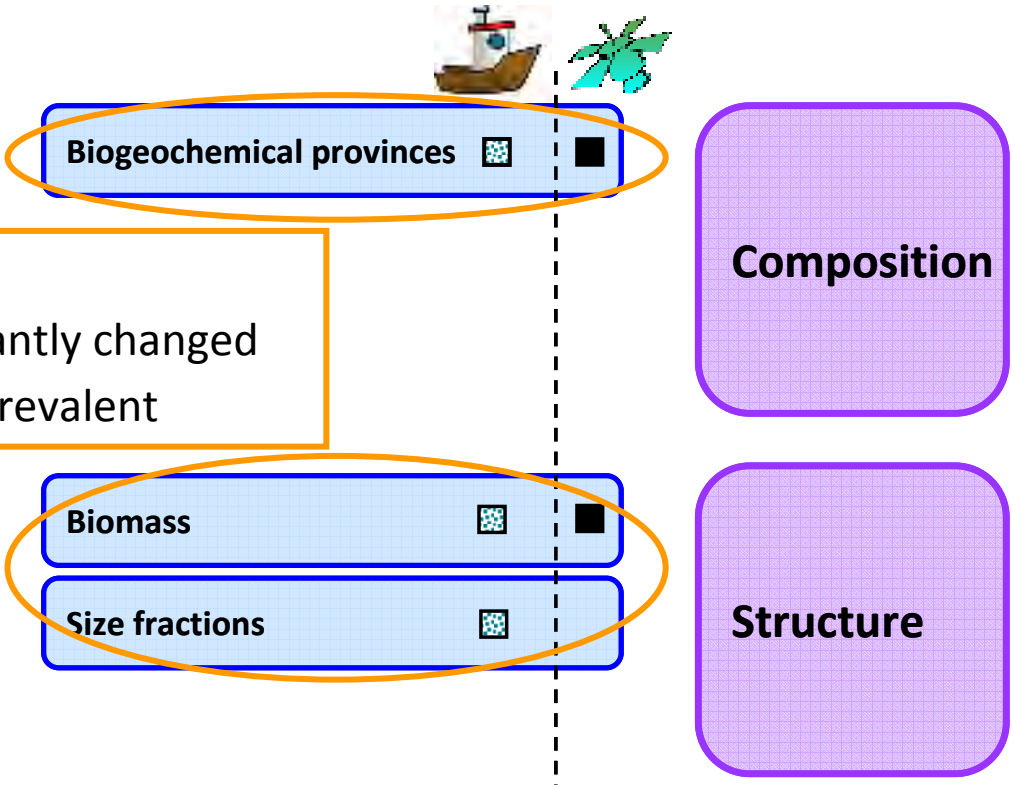

### Statistically significant changes in phytoplankton size fractions:

- . Decline in MICRO (phytoplankton) size fraction
- . Both increases and decreases in NANO and PICO size fractions

## Case study 1 10 years

- Representativeness of ship sampling
- Total phyto biomass has not significantly changed
- Smaller phyto. have become more prevalent

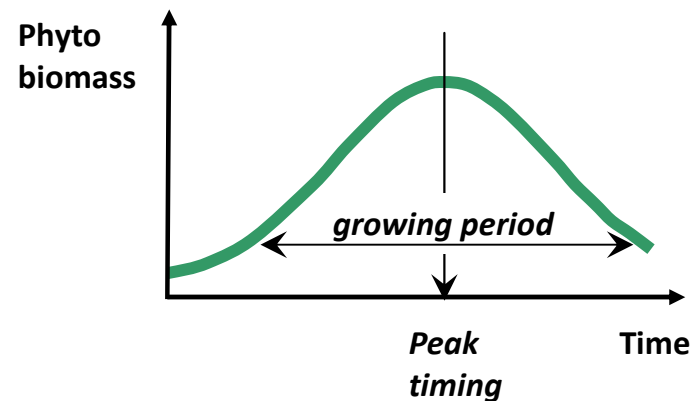

---

## Case study 2

# Decadal variability in phytoplankton phenology

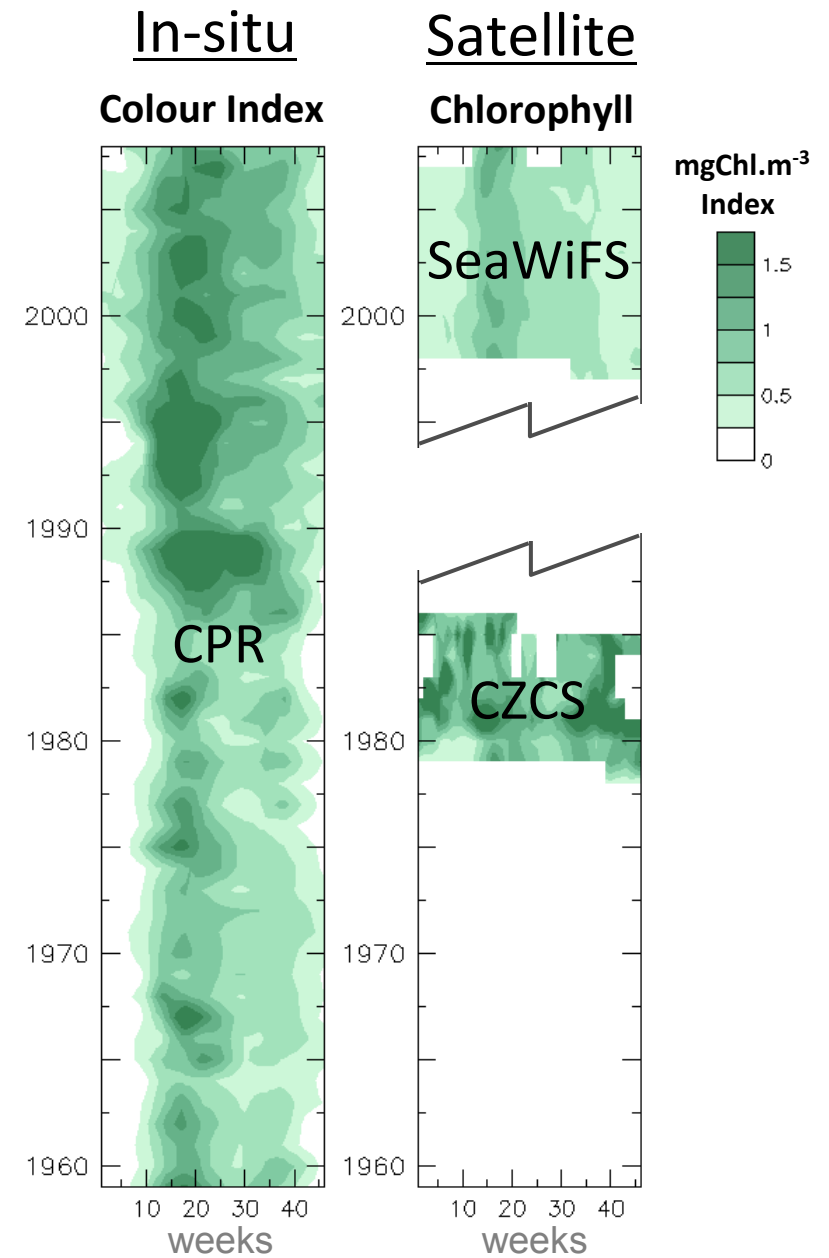

*Phenology: study of timing of events*

Method from Racault *et al.* (2012)

# How phytoplankton phenology varies on decadal scale in the North Atlantic?

## Continuous Plankton Recorder (CPR) 1958 - 2008

## Time-series consistency

### Integration of phenology indicator with the network of observations

Advantages of **relative indicator** over absolute one:

- bring together data from various satellite sensors
- synthesis of in-situ and remote sensing phyto biomass estimates

### Areas selection based on:

In-situ data availability  
1958-2008

In-situ and Sat. data availability  
1998-2008

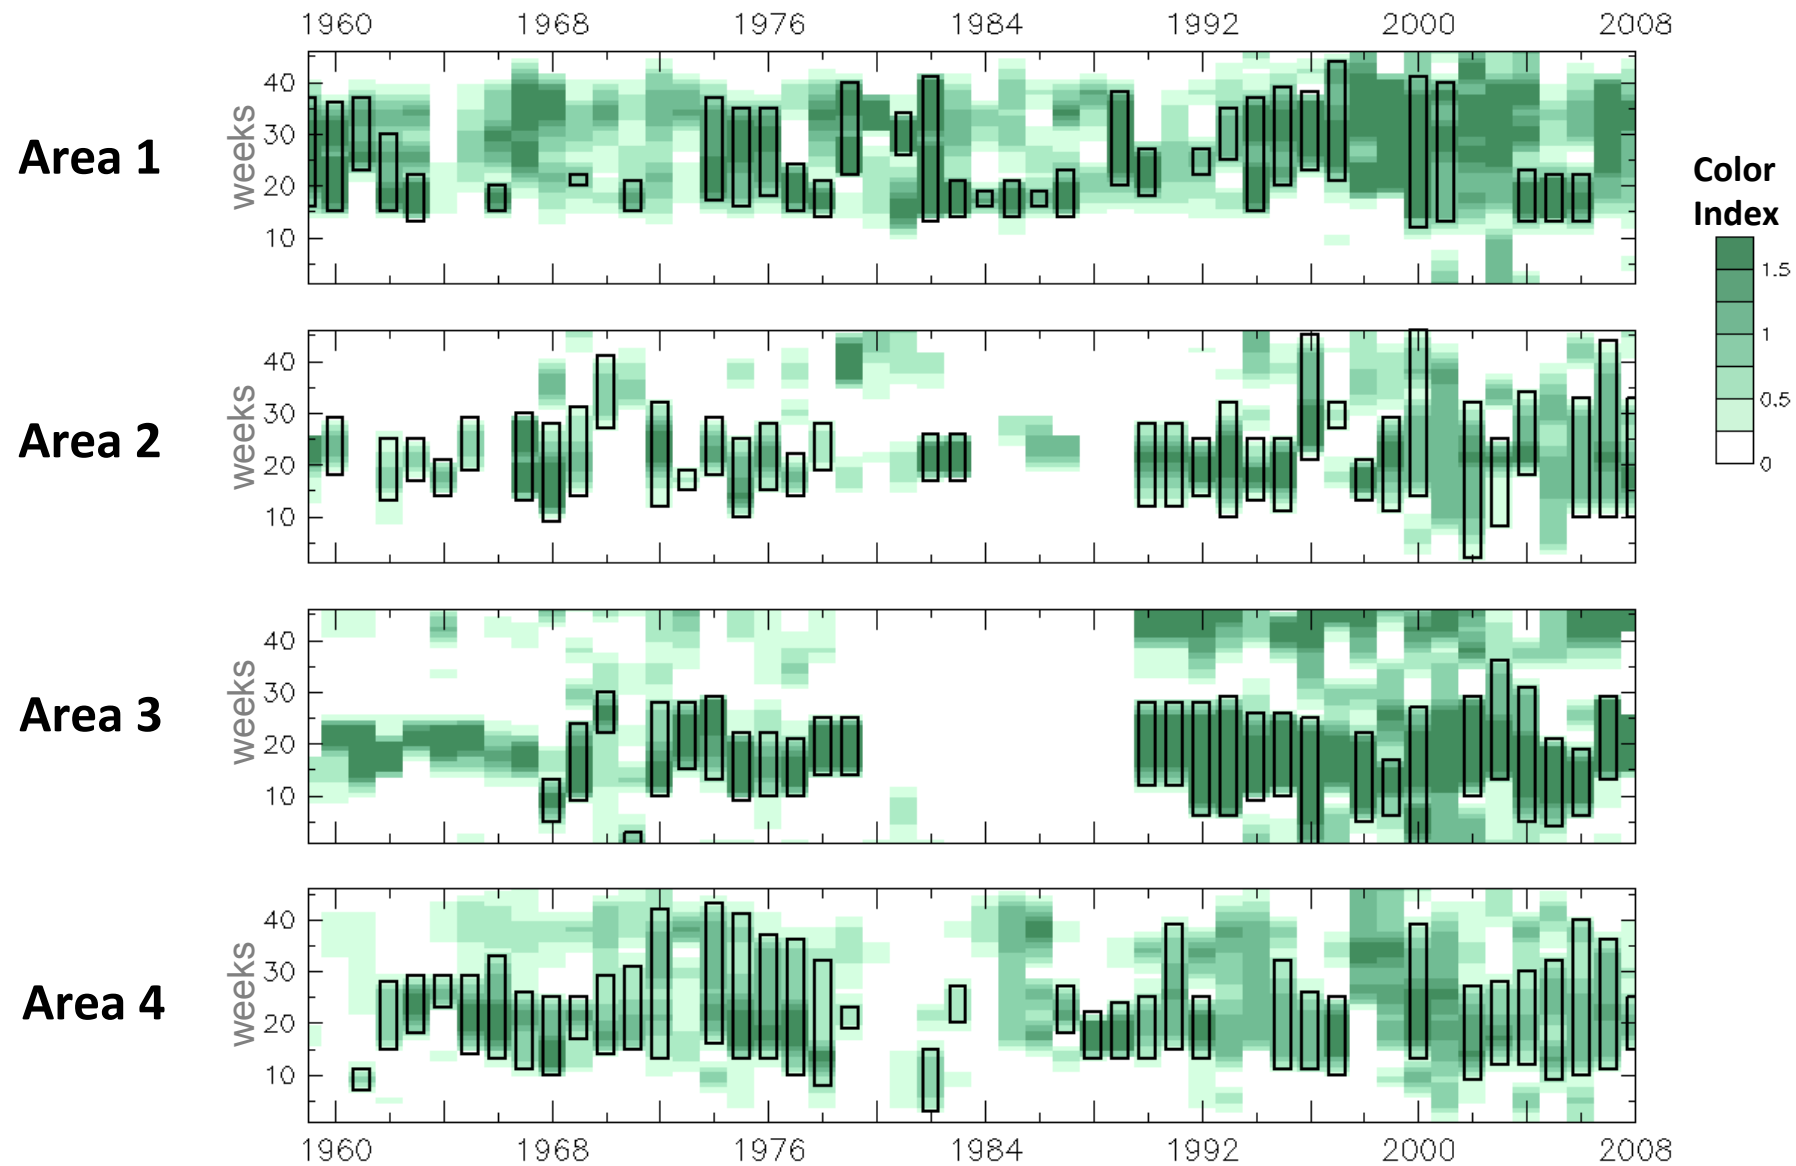

t-test on peak timing  
between In-situ and Sat.

# Phytoplankton phenology 1958 - 2008

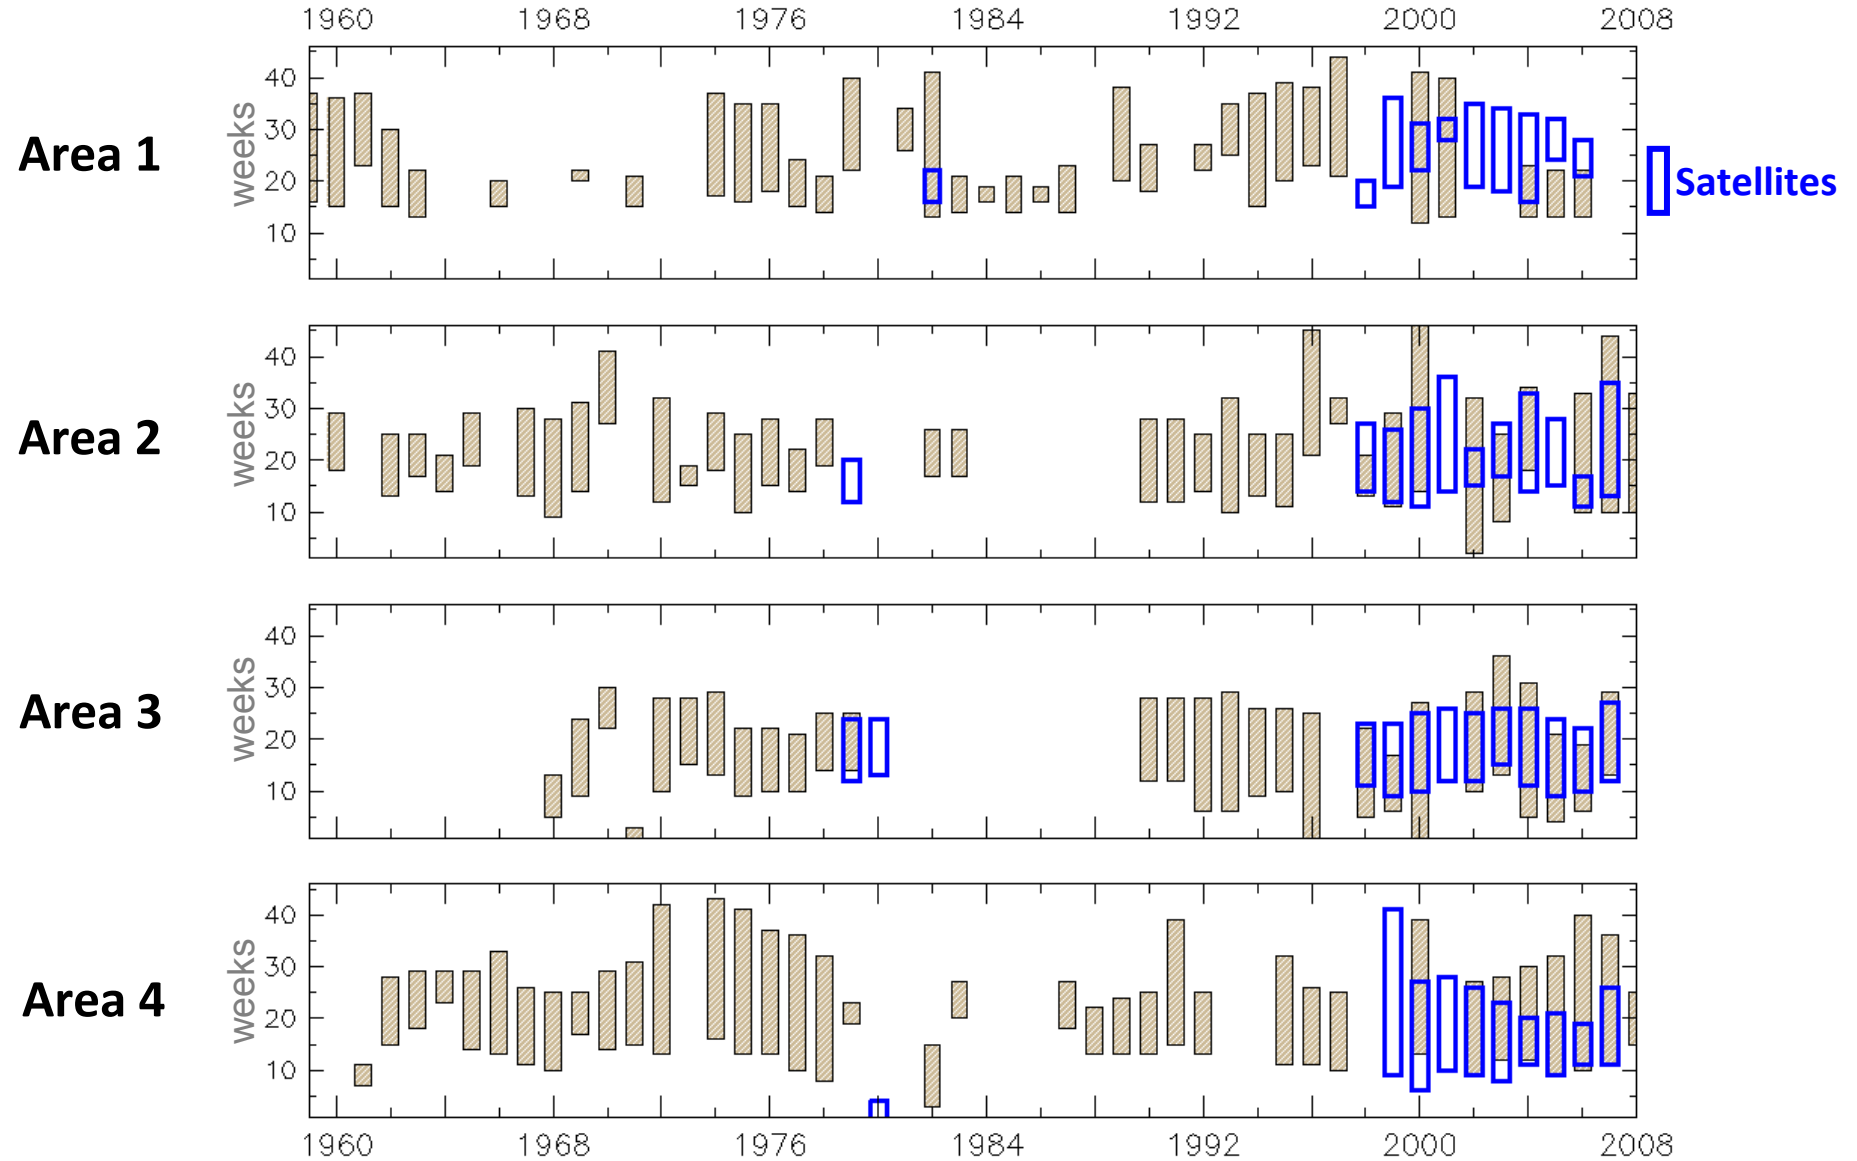

## In-situ: Continuous Plankton Recorder

# Phytoplankton phenology 1958 - 2008

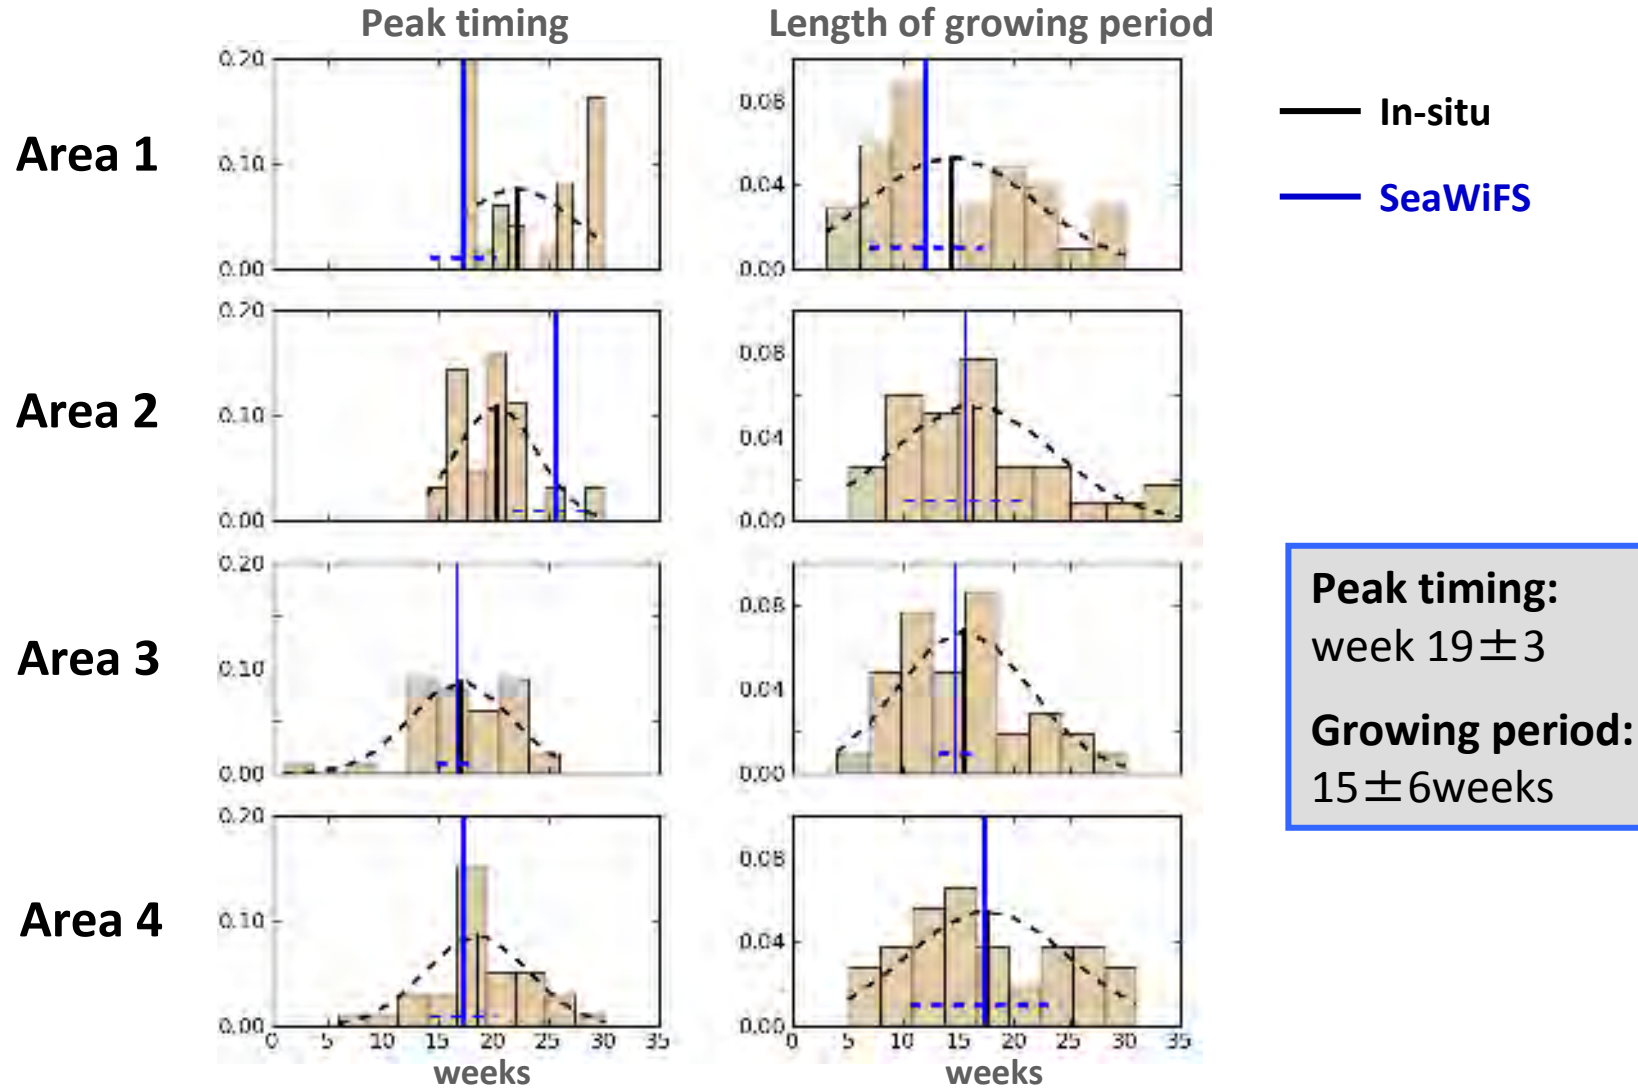

## In-situ: Continuous Plankton Recorder

# Decadal variability in phytoplankton phenology

## Frequency distributions

## Case study 1 10 years

- Representativeness of ship sampling
- Total phyto biomass has not significantly changed
- Smaller phyto. have become more prevalent

Biogeochemical provinces

Biomass

Size fractions

Phenology

Composition

Structure

Functioning

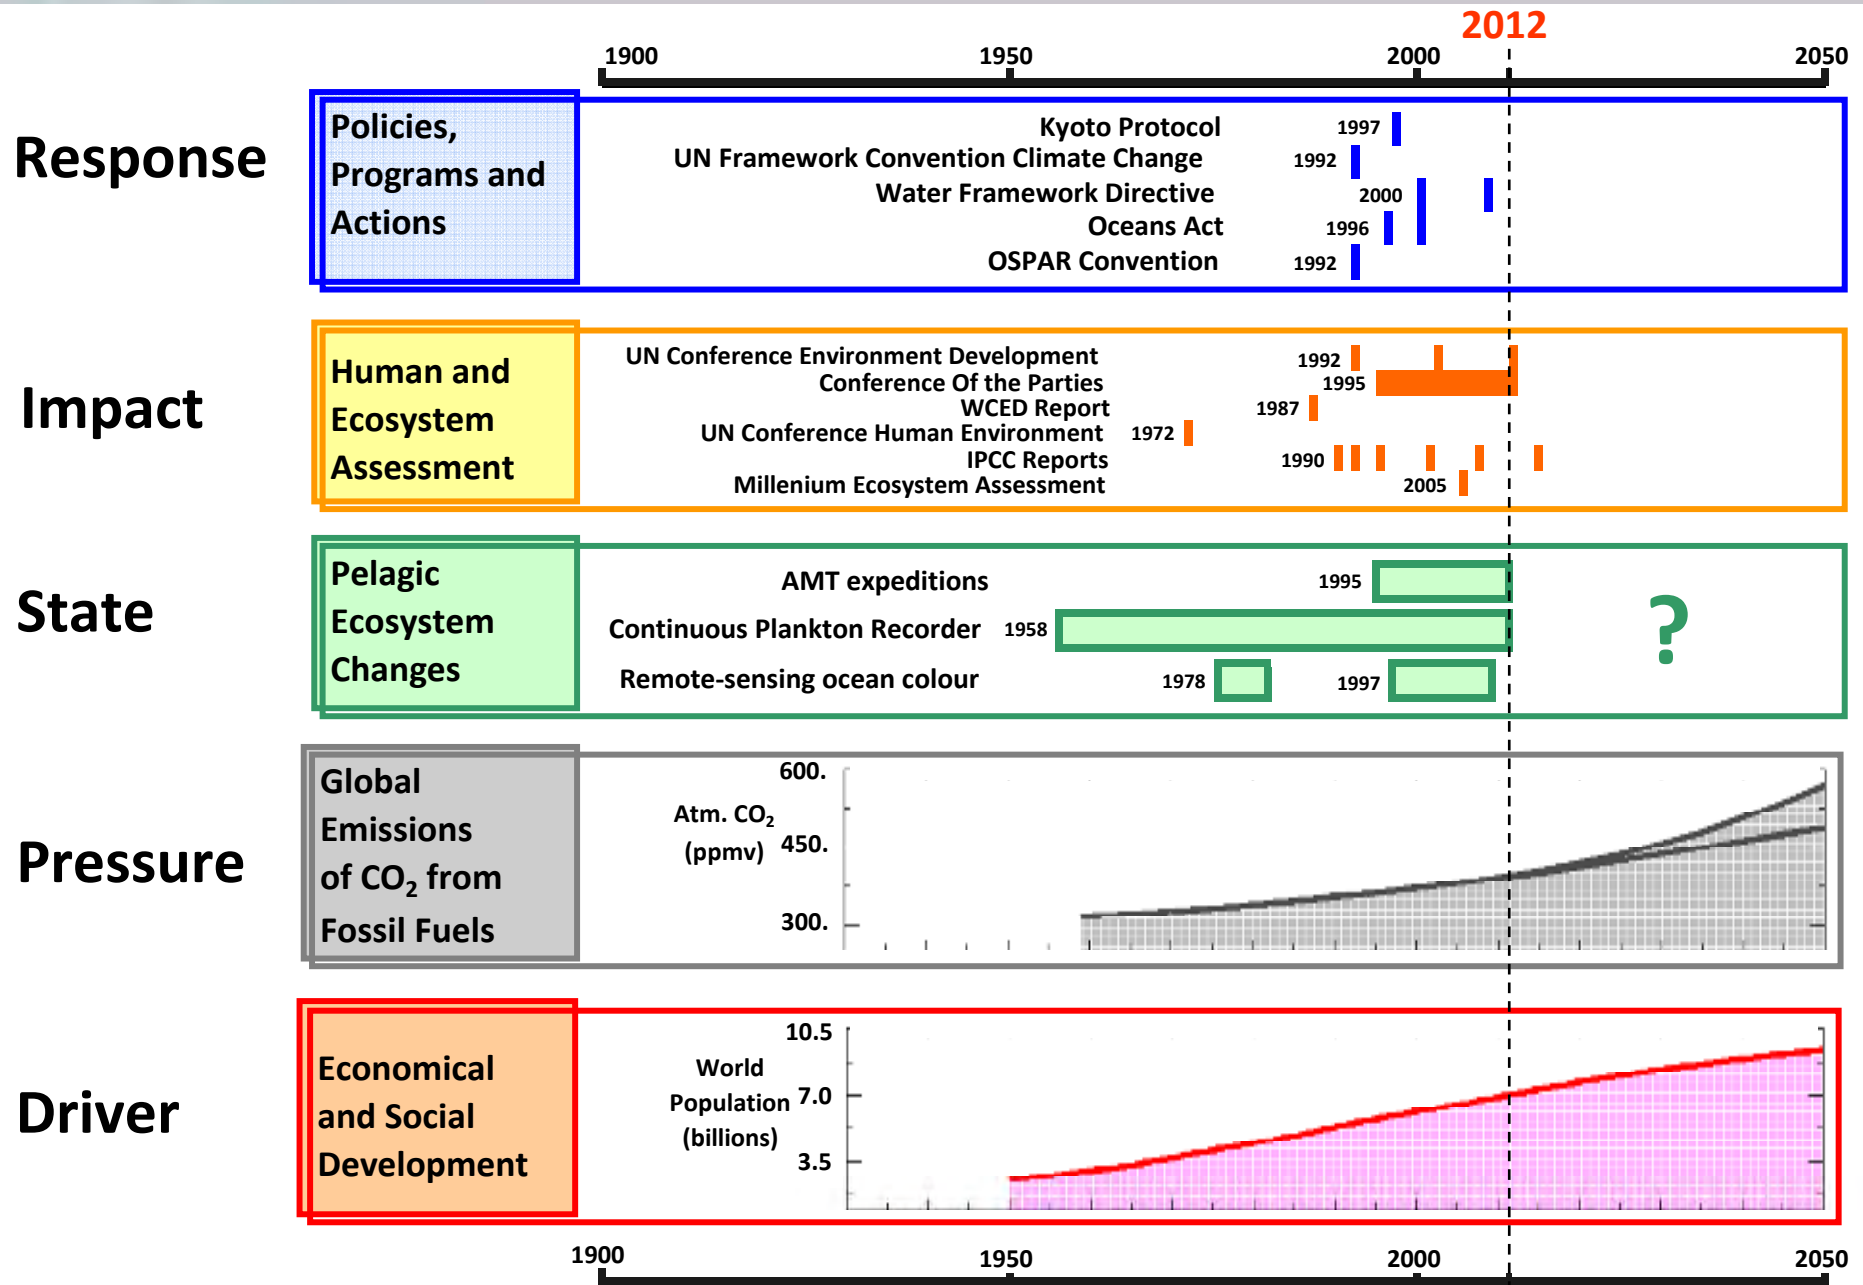

## Case study 2 50 years

- Growing period:  $15 \pm 6$  weeks

- When we are required to combine quite different set of data, it may be rather difficult to make strong conclusions about trends
  
- Apparent consistency inferred from stable structural properties (such as autotrophic biomass) may conceal significant changes at the community level (such as seen in the size fractions)
  
- Develop and support:
  - . Collaboration
  - . Evaluation of representativeness of discrete sampling
  - . Indicators based on relative signal patterns
  - . Evidence-based research
  - . Observations – integrated indicators approach
  - . Funding to maintain and extend time-series of observations
