

Linking climate variability to rockfish recruitment.

Pacific ocean perch in the Queen Charlotte Sound as a case study.

Effects of Climate Change on the World's Oceans, March 2015

Context and objectives

Context

- ▶ Stock assessment
- ▶ Global change
- ▶ Ecosystem approach to management

Fisheries and Oceans
Canada

Objectives

- ▶ Identify association between climate and recruitment
- ▶ Developing quantitative tools
- ▶ Incorporate tools to the Ecosystem approach to management

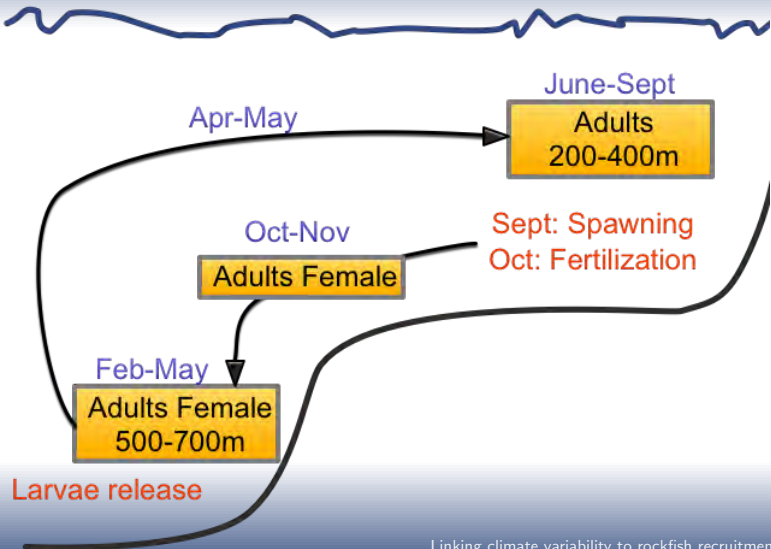

Pacific Ocean Perch

- ▶ most abundant rockfish species on Canada's west coast
- ▶ coast-wide landed value of \$4.4 million per year
- ▶ females up to maximum 1.8kg, 48cm, males 1.4kg, 44cm
- ▶ two specimens >100 years old

Reproduction

Study area

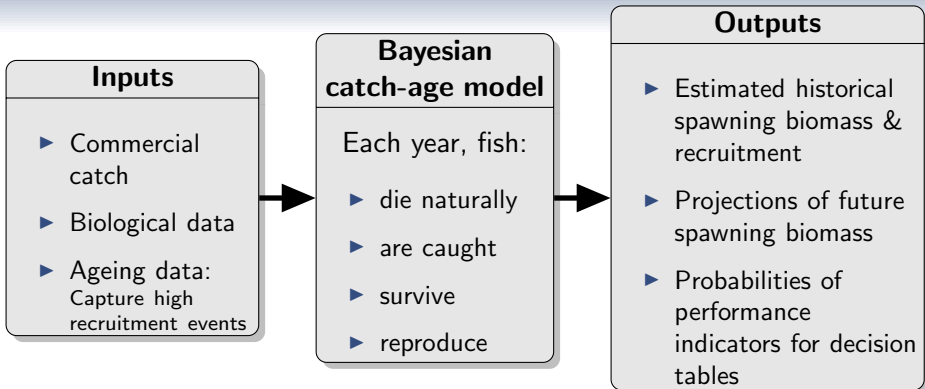

Study area

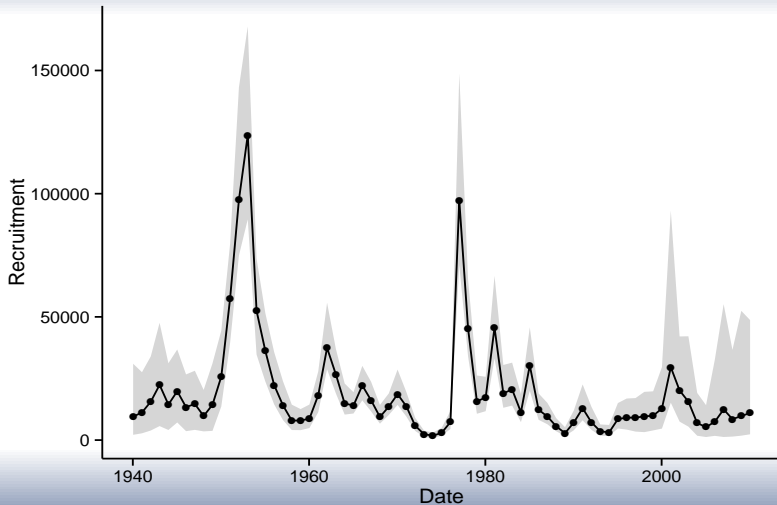

A catch at age model

- age classes 1 to 30+
- males and females
- starts in 1940
- 5 years projections

Model outputs: Recruitment

Environmental linear effects

The log of the recruitment (R) at year t is normally distributed with mean μ_t and variance σ^2 :

$$\log(R_t) \sim \text{Normal}(\mu_t, \sigma^2)$$

$$\mu_t = \alpha + \beta * \text{Covariate}_{t-1}$$

- ▶ α intercept
- ▶ β environmental covariate effects
- ▶ Bayesian inference

Environmental non-linear effects

The log of the recruitment (R) at year t is normally distributed with mean μ_t and variance σ^2 :

$$\log(R_{i,t}) \sim \text{Normal}(\mu_{i,t}, \sigma^2)$$

$$\mu_{i,t} = \alpha + \beta_i * \text{Covariate}_{t-1}$$

- ▶ α intercept
- ▶ β_i covariate effect of class i
- ▶ Covariate_{t-1} are split into classes $i = 1, \dots, N$
- ▶ Bayesian inference

Bayesian approach accounts for uncertainty

Environmental variables available

Regional variables:

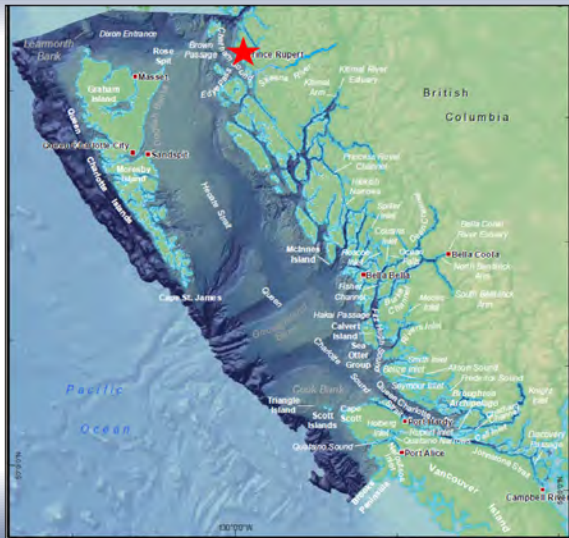

- ▶ Sea level at Prince Rupert (BC):
1940-2010
- ▶ Haida eddies cover area:
1993-2010

Large scale variables:

- ▶ East Pacific/North Pacific Oscillation:
1950-2010
- ▶ North Pacific Gyre Oscillation Index:
1950-2010
- ▶ Pacific Decadal Oscillation Index:
1950-2010

Linking climate variability to rockfish recruitment

Location of Haida eddies

Location of Haida eddies

Structure of Haida eddies

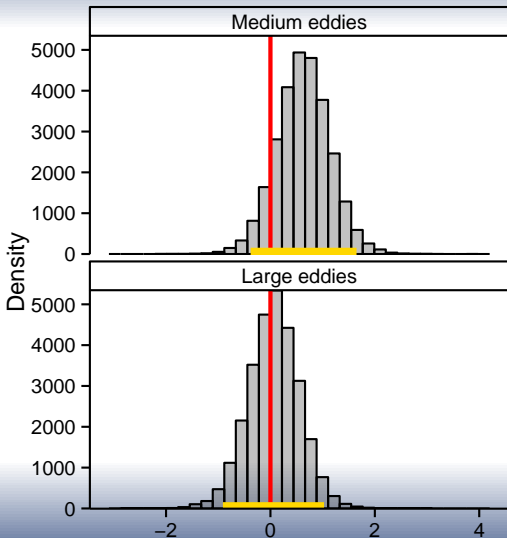

Credit: *Robert Simmon*

- ▶ Anticyclonic rotation
- ▶ $\sim 200\text{km}$ diameter
- ▶ Form in late winter

Non-linear effect of Haida eddies

- ▶ No effect of the small eddies
- ▶ Positive effect of the medium eddies
- ▶ No effect of the large eddies

East Pacific/North Pacific Oscillation

Pacific Decadal Oscillation Index

North Pacific Gyre Oscillation Index

Conceptual mechanism approach

Negative phase

Main contributions

Bayesian approach:

- ▶ Used for explanatory analysis
- ▶ Flexible approach
- ▶ Fully account for uncertainty

Conceptual mechanism:

- ▶ Qualitative relations between environment and recruitment
- ▶ Regional and large scale environment variables

Perspective: Describe this conceptual mechanism in a Bayesian network to test climatic/global change scenario

Thank you for your attention.
