

Recent developments in molecular diagnostic technology for HAB detection

Nagai S,

Fisheries Research Agency of Japan, Hiroshima, Japan, snagai@affrc.go.jp

PICES 2010 Annual Meeting in Workshop 3 (MEQ) - 'New technologies and methods in HAB detection: I. HAB species detection', on October 23 2010 in Portland, U.S.A.

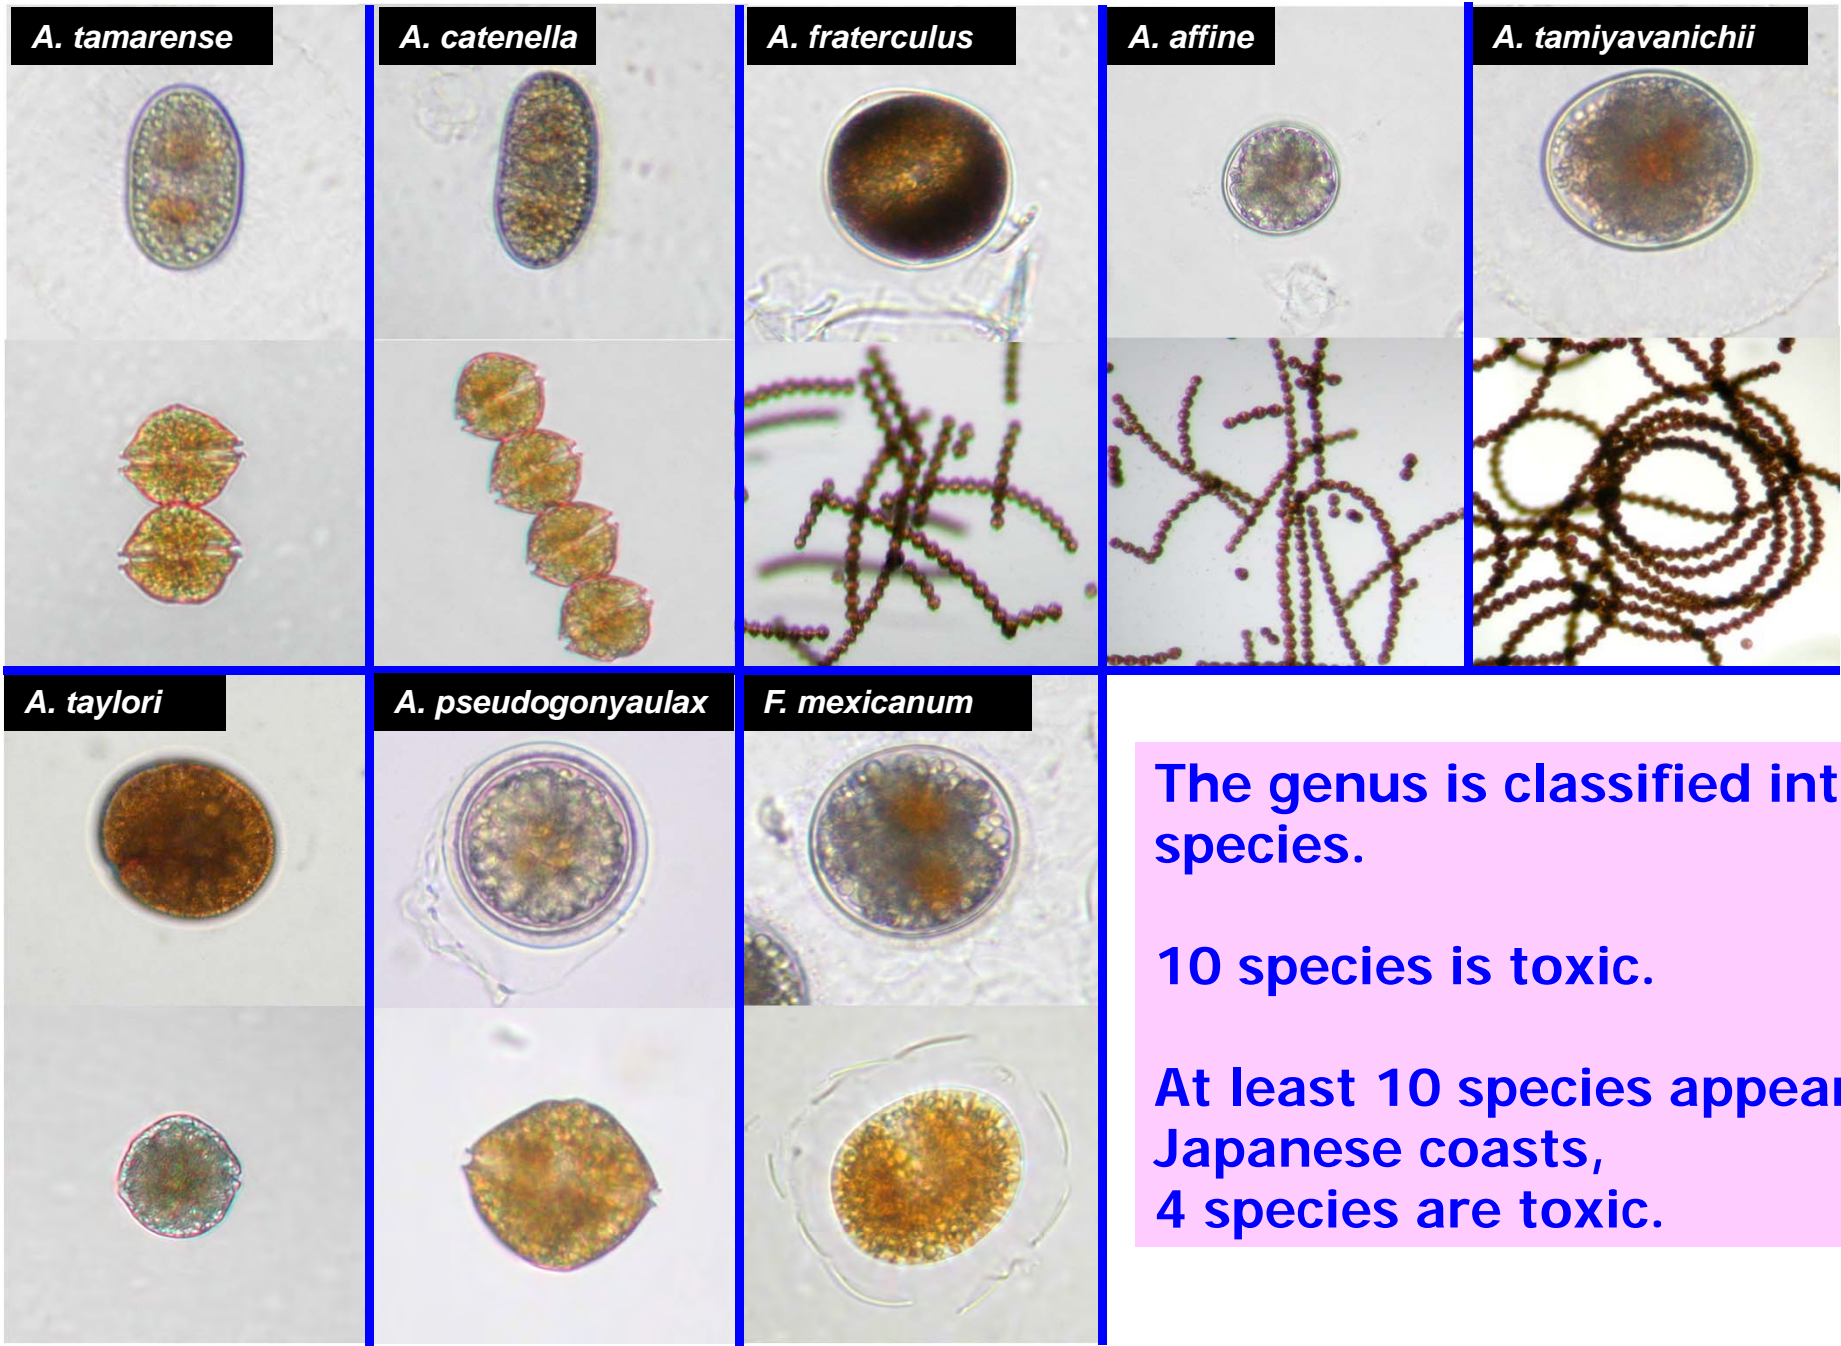

Contents of my talk

- Present situation of HAB monitoring in Japan
- PCR-RFLP
- FISH (Fluorescence In Situ Hybridization)
- Real time q-PCR
- LAMP (Loopmediated isothermal Amplification)
- Multiplex-PCR
- Metagenome by 454 sequencing

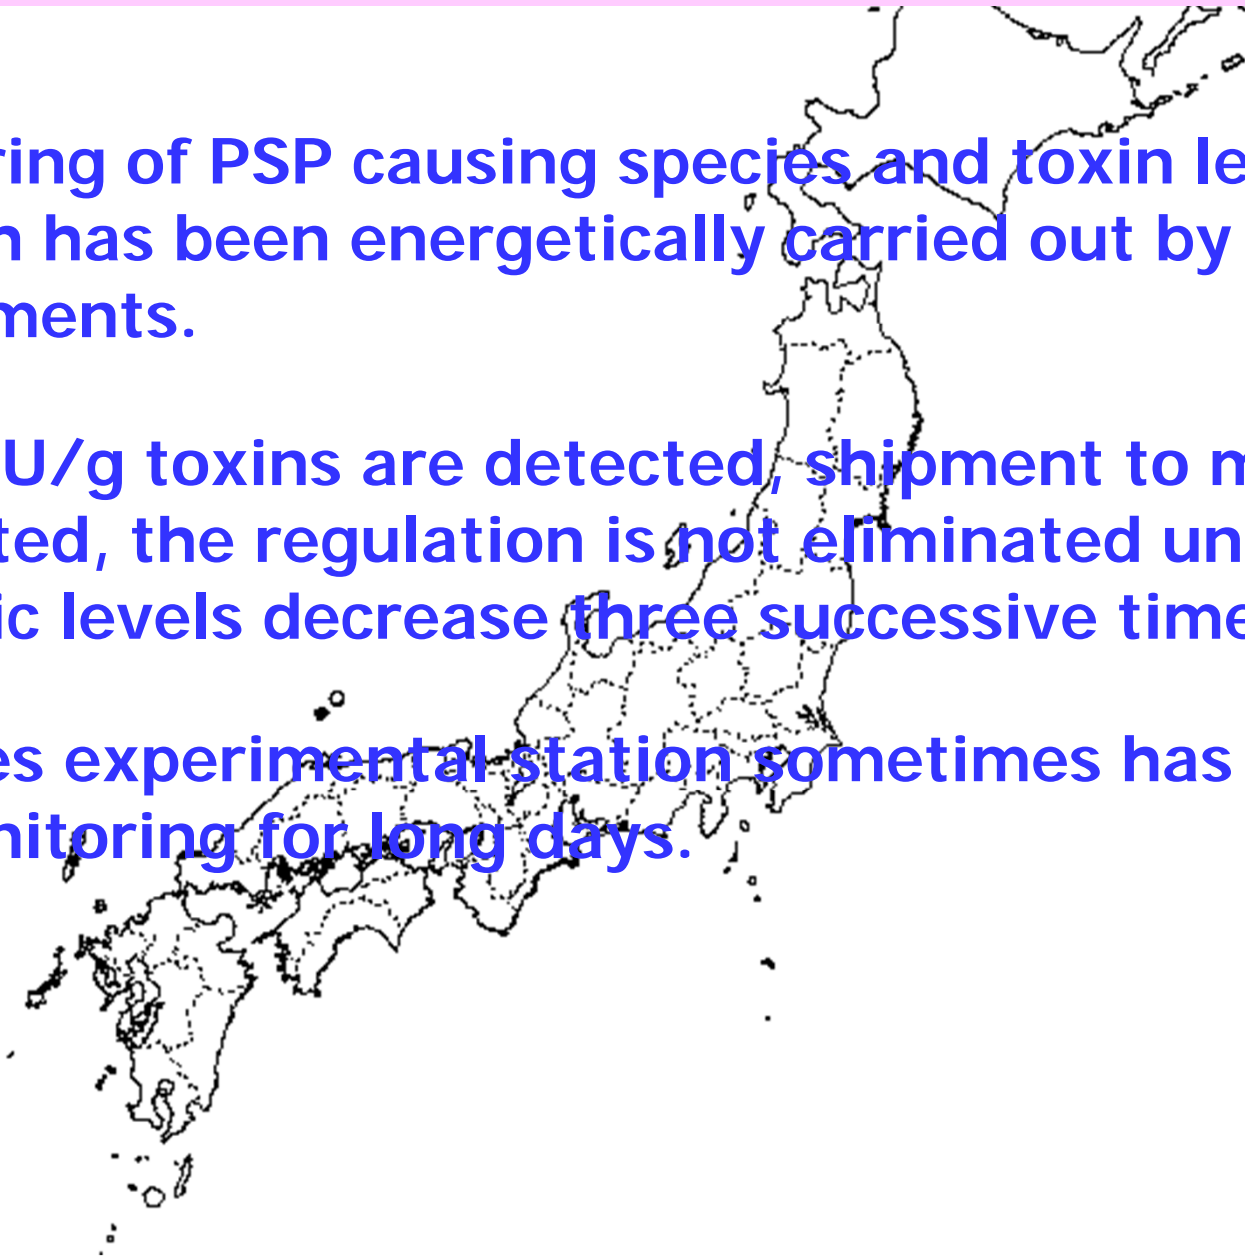

the criteria of classification of species

Alexandriumの鎧版配列模式図 (研究代表者 福代康夫氏科研費報告書より引用)

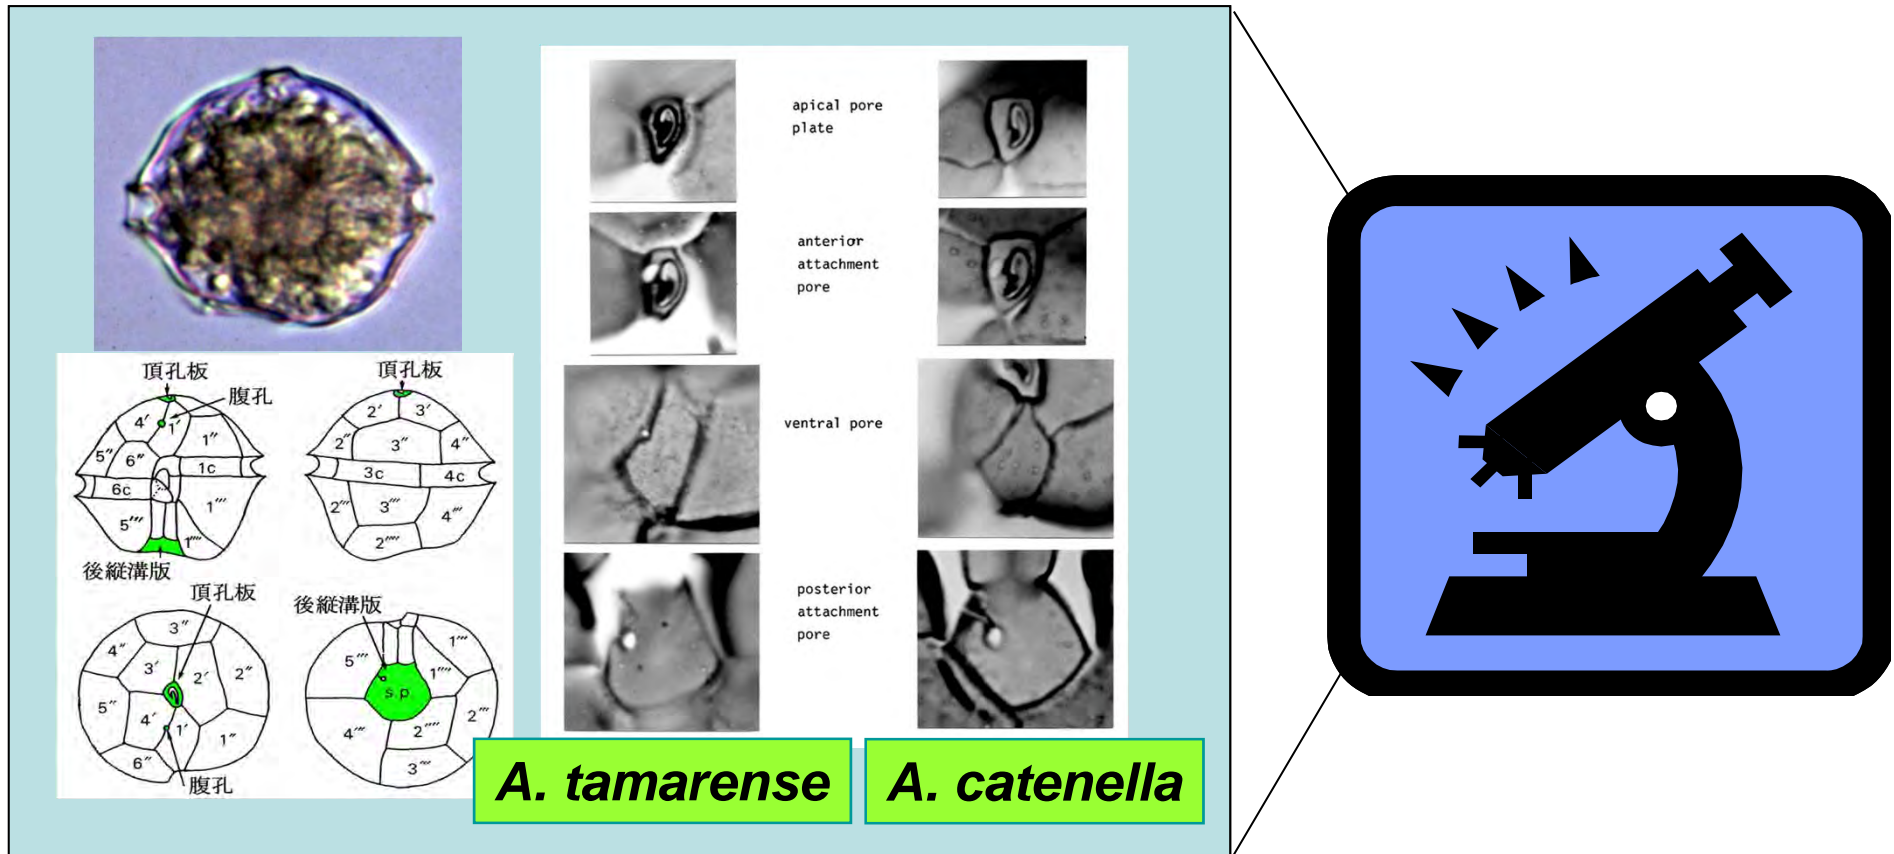

Monitoring system of PSP in Japan

- Monitoring of PSP causing species and toxin levels in shellfish has been energetically carried out by regional governments.
- If >4 MU/g toxins are detected, shipment to market is prohibited, the regulation is not eliminated until when the toxic levels decrease three successive times.
- Fisheries experimental station sometimes has to continue the monitoring for long days.

Monitoring of toxic phytoplankton

It is not so easy to distinguish the plate morphology.

It is required knowledge, experiences and skills.

Very complicated specimens were sampled in Tottori Pref. in May 2006

Posterior sulcal plate is similar to *A. tamarense*.

Alignment of *A. catenella* (ITS)

```

- Kagawa Pref.
- Mie Pref.
- Hiroshima Pref.
- Tottori Pref.

Sequences are all identical to typical Japanese *catenella*.

Color of culture
Growth at high temp.

Finally this specimen was judged as *A. catenella*.

We have an annual training course on identification of toxic phytoplankton (sponsored by Fisheries Agency of Japan)

By frequent personnel reshuffling of regional governmental researchers

every 2-3 years

Lack of experience and skills. In addition...
Lack of infrastructure by dwindling budgets.

→This is the real situation of HAB monitoring in Japan

Development of easy, accurate, inexpensive
molecular identification tools has been required.

Contents of my talk

Species identification of HAB species by use of molecular technique

- PCR-RFLP
- FISH (Fluorescence In Situ Hybridization)
- Real time q-PCR
- LAMP (Loop Mediated Amplification)
- Multiplex-PCR
- Metagenome by 454 sequencing

PCR–RFLP (Restriction Fragment Length Polymorphism)

PCR amplification → Digestion by enzymes → Restriction site depends

Nuclear SSU, LSU or ITS

By Scholin et al. (1995), Adachi et al. (1996)

Fluorescence *In Situ* Hybridization (FISH)

Target : ribosomal DNA or RNA

FITC labeled rRNA
targeted probe

hybridization

FISH

by FITC-labeled probe

DAPI staining

Horseshoe-like shape

In rRNA FISH,

Ribosomal RNA genes are expressed in the ribosome.

RNA-target probe works only in cytoplasm.

There are so many copies in cytoplasm.

→High florescent intensity is obtained.

Double staining of *Alexandrium* cells by FITC-FISH and Calcofluor-White MR2

FITC-labeled probe

Calcofluor-white

Normal Light

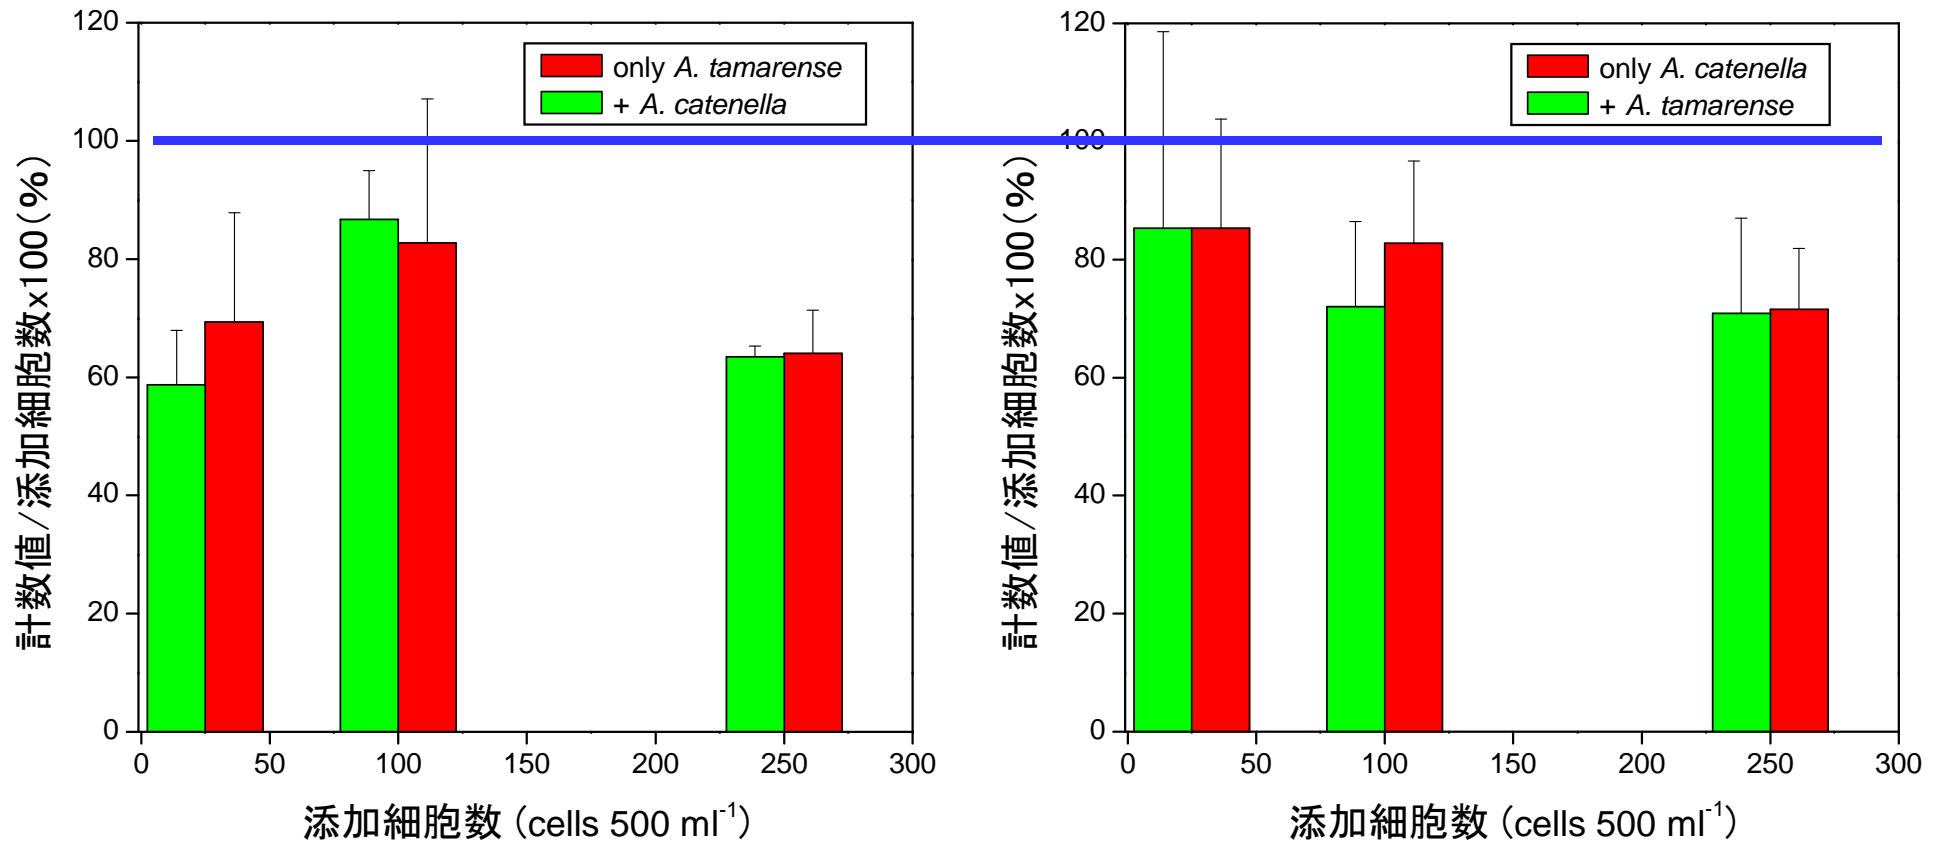

No need to extract RNA and we can observe the cell morphology.

→ **Good point: FISH is possible to quantify.**

However, the amount of RNA varies depending conditions.

→ **weak point: RNA levels depend on individuals in natural sample.**

Enumeration of *Alexandrium* cultured cells mixed with natural plankton samples

A 500 mL of natural sample was concentrated to 500 μ L and *Alexandrium* cultured cells were added and enumerated the cell density.

Recovery rate: 60-85% in both species

Detection and quantification of HAB species by real time q-PCR

As PCR-amplification increases, probes hybridize to the target gene and fluorescence intensity increases, therefore, it is possible to quantify the amount of DNA containing samples.

Real time q-PCR to draw the calibration curve in vegetative cells of *G. catenatum*.

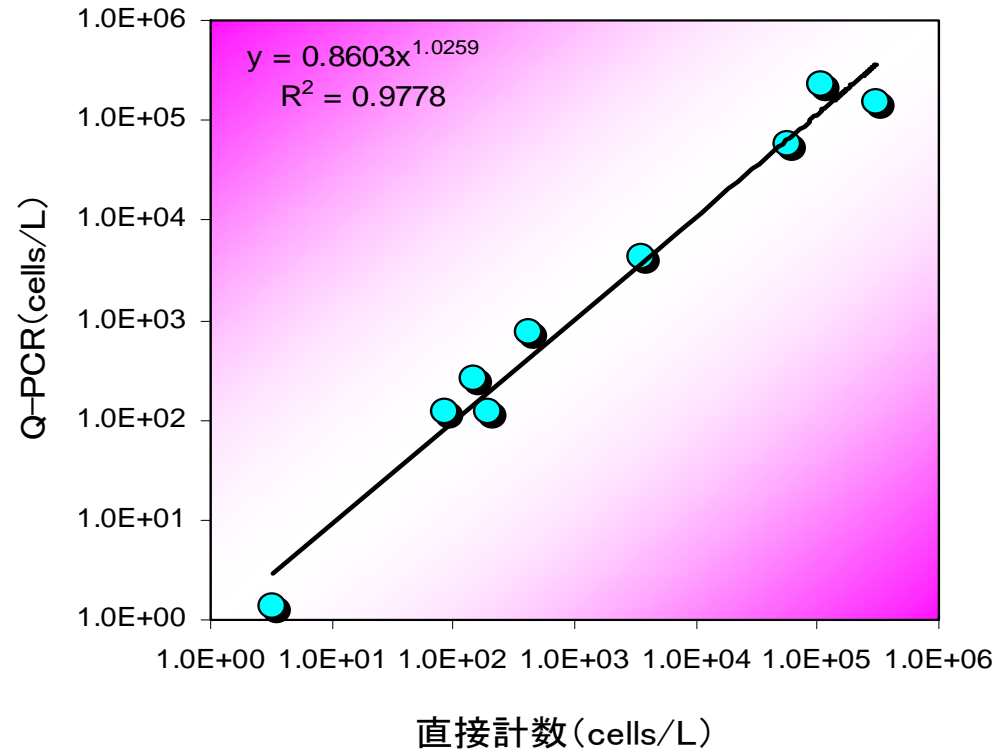

Estimation of cell abundance from the cycle threshold in *G. catenatum*.

Abundance of vegetative cells in *G. catenatum* by real time q-PCR (Jan-May in 2006)

	direct count		Q-PCR	
	Mean (n=3)	SD	Mean (n=3)	SD
23-Jan	3	3	1	2
13-Feb	414	137	751	236
20-Feb	192	5	120	37
6-Mar	85	31	119	12
14-Mar	147	49	265	56
20-Mar	3,500	1,645	4,177	1,128
17-Apr	57,000	45,902	56,544	16,860
26-Apr	110,000	10,000	226,011	65,933
1-May	303,333	92,916	152,222	31,183

Unit: cells/L

Correlation between direct count and quantification by Q-PCR

LAMP (Loopmediated isothermal Amplification)

◇ No need for a step to denature double stranded DNA into a single stranded form.

→ *BST* polymerase synthesizes complement DNAs with dissociating the double strand.

◇ The whole amplification reaction takes place continuously under isothermal conditions (60 to 65°C)

→ Easy to operate with simple equipments (blockheater or dry oven)

Normal PCR

LAMP

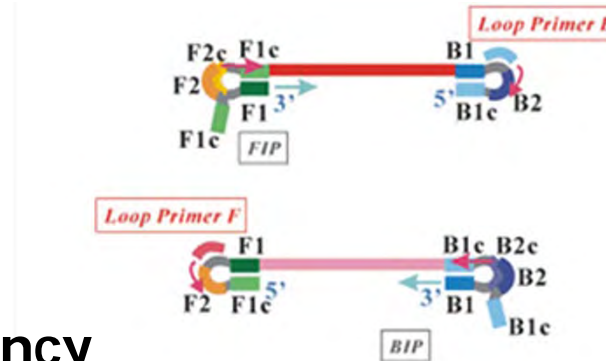

isothermal

Characteristics of LAMP

◇ Amplification starts from several points by use of 6 primers to recognize 8 distinct regions.

→ It occasionally causes none-specific amplification.

◇ Extremely High amplification efficiency

→ Isothermal amplification occurs from several regions.

→ DNA will be amplified 10^9 - 10^{10} times in 15-60 minutes

◇ Magnesium pyrophosphate, a by-product of the amplification reaction, is produced in proportion to the amount of amplified products.

→ White turbidity can be visually observed.

◇ Total cost can be reduced, as LAMP does not require special reagents or sophisticated equipments.

Easy detection by LAMP

L1 L2 L3 L4 L5 L6 L7 L8

Lane1, *A. tamarensis* (5ng)

L2, *A. tamarensis* (single cell)

L3, *A. catenella* (>10ng)

L4, *A. tamiyavanichii* (>10ng)

L5, *A. fraterculus* (>10ng)

L6, *A. affine* (>10ng)

L7, *A. minutum* (>10ng)

L8, *A. ostenfeldii* (>10ng)

(Lane3-8 emit no fluorescence)

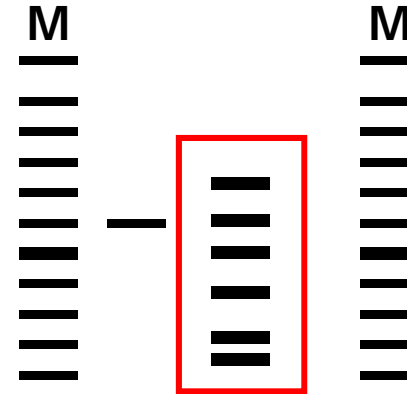

LAMP primers for *A. tamarensis* is able to specifically amplify *A. tamarensis* DNA!

Development of a multiplex PCR assay for simultaneous detection of 6 *Alexandrium* species

Multiplex PCR:

amplifying several target regions at one time by mix of different primer pairs.

The length of PCR product was changed in every species. Therefore, six species are detectable at one time.

Target region:

Nuclear LSU, D1/D2 region or nuclear 5.8S-rDNA+ITS regions

Primer design and screening

2	95	30 sec	30
	61	90 sec	
	72	30 sec	
3	60	30 min	1
	4	∞	

Characteristics:

12 primers are mixed.
PCR kit for multiplex is used.
Annealing is longer than usual.

Optimization of PCR conditions

60°C

All 6 species DNAs were mixed.

63°C

Following 4 species DNAs were mixed.
A. affine, *catenella*, *fraterculus*,
tamiyavanichii

← Single cells PCR

**Succeed brilliantly
Congratulation!**

Application to natural samples

To establish *A. catenella* clonal strains from a sediment form New Zealand, I was doing sediment incubation, but many small *A. pseudogoniaulax* cells appeared in that sample. It was very difficult to exactly distinguish, therefore, I checked them by Multiplex-PCR.

Single cell-Multiplex PCR was carried out.

Succeed brilliantly
Congratulation!

Species-specific amplification by the multiplex-PCR technique developed in this study.

*, **, *Alexandrium catenella*, *A. tamarensis* and *A. pseudonogialax* cells were obtained from seawaters in April, 2010 and single cells were used for the species identification.

I am developing the multiplex PCR for these species at present.

Karenia brevis, *K. degitata*, *Chattonella antiqua*,
C. marina, *C. ovata*, *Cochlodinium polykrikoides*,
Heterocapsa circularisquama, *Heterosigma akashiwo*

Metagenome analysis of marine plankton using next generation sequencer

phytoplankton

protozoa

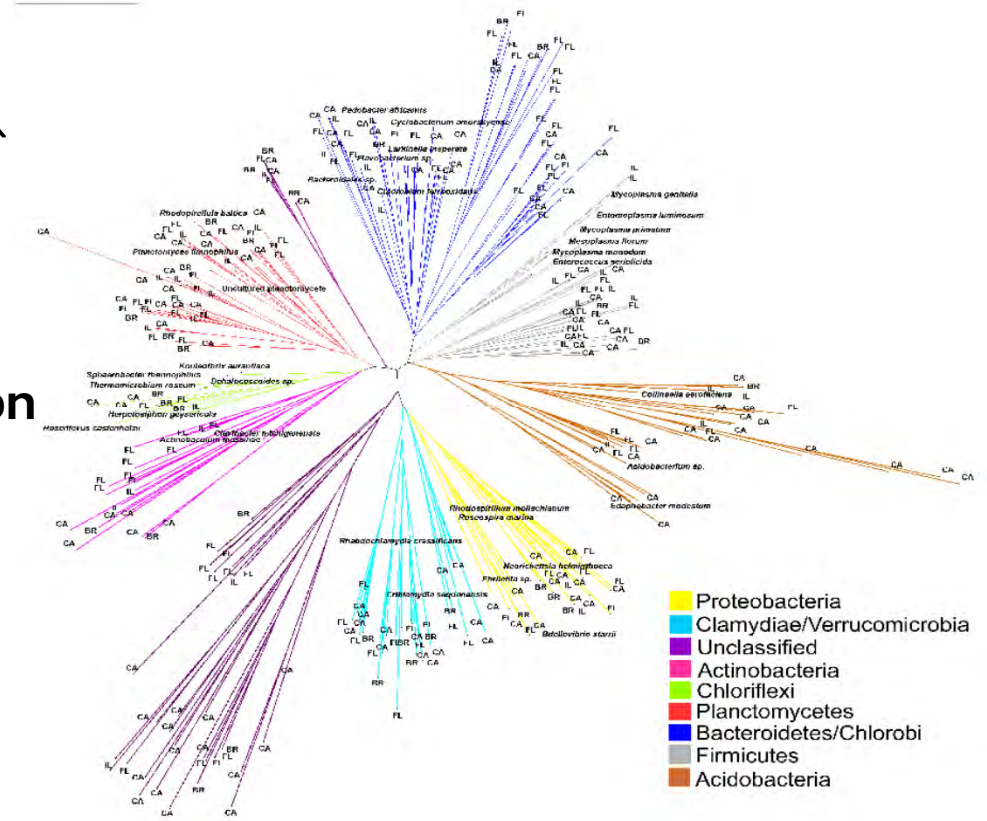

zooplankton

filtration

sampling

Background of research

- Cell delicateness in most species

Cells do not fossilize in most of the species.

- Hardness to know the species had appeared in the past

Preservation of appearance records is important.

- Difficulty of identification of species $<10\mu\text{m}$ in size

Registration of sequence data with morphological information should be enhanced.

Development of next generation sequencer

- Mechanization from 2008

Companies are developing one machine after another.

- Incredible performances

Coming of sequence revolution

- Transition from metagenome to petagenome

We have to struggle with huge amounts of genetic data. Not only hard- but also software should be developed.

- Changes of monitoring style, from morphology based to genetic

We can apply metagenome analysis to monitoring of coastal environments by 454 sequencing.

What is metagenome analysis?

PCR amplification using universal primers
and 454 sequencing

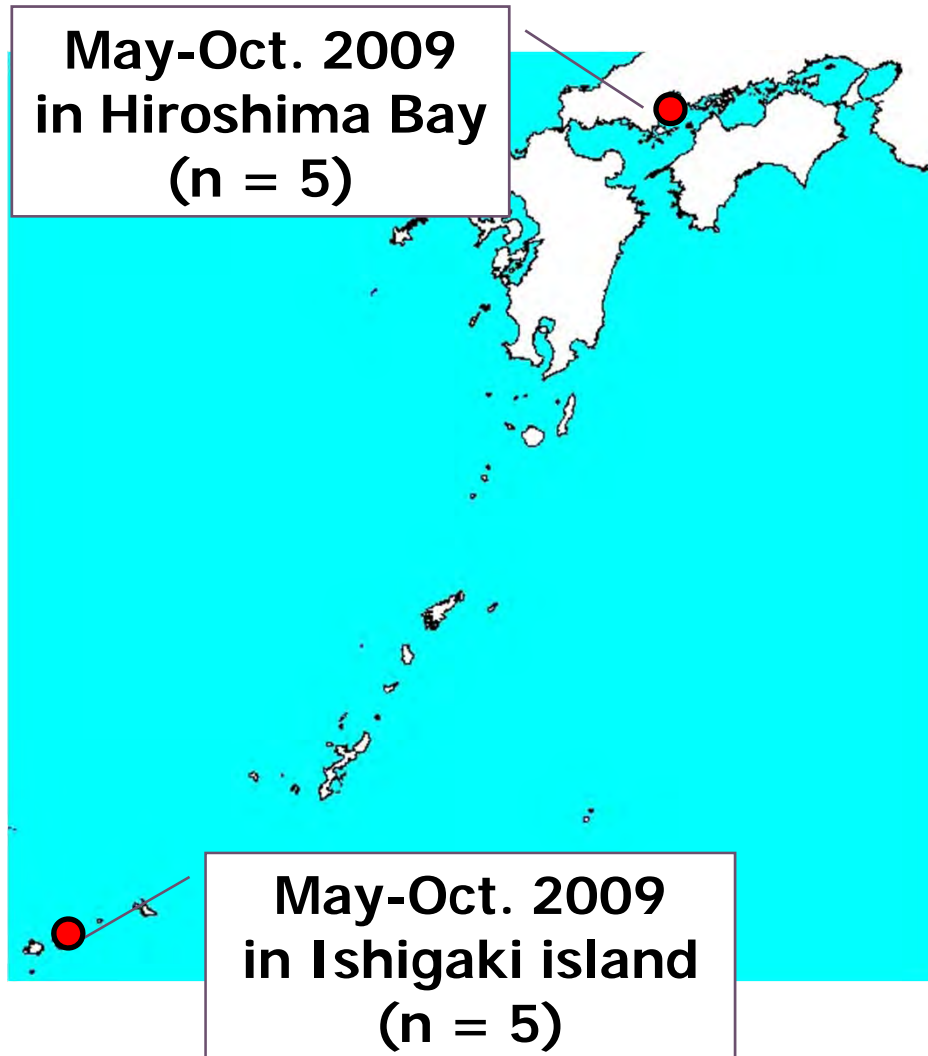

Records of all species in marine
ecosystems and database construction

Comparison of marine
biodiversity/investigation of its distribution/
detection of new invasive species

Materials & Methods

● plankton sampling

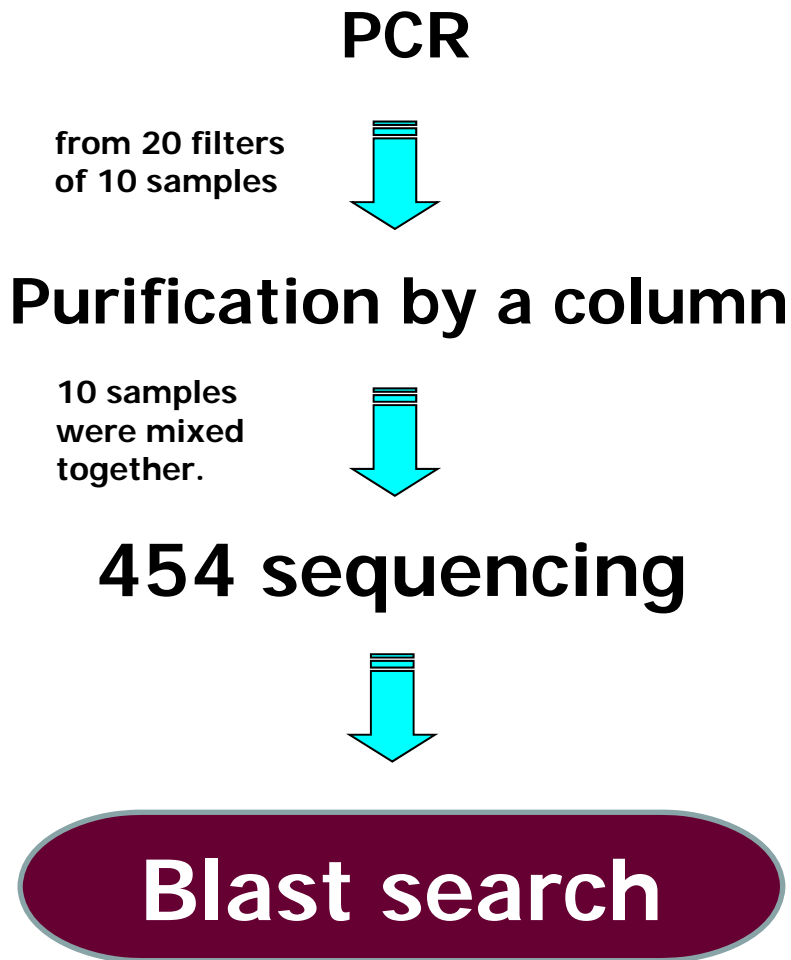

● harvest

Filtration of 500 mL seawater
by nylon mesh ($\Phi 75\mu\text{m}$)

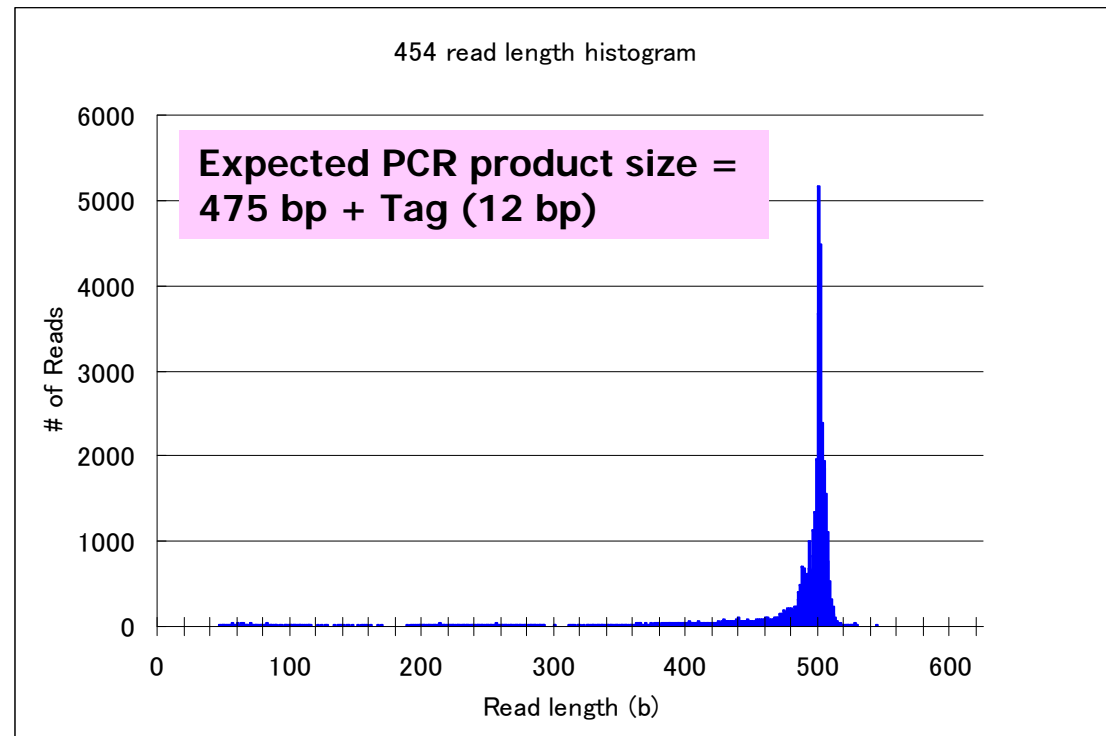

trap plankton on filters and
DNA extraction from filters

454 sequencing by universal-PCR

Contents	Results
Total amount of sequences	50,521
Total amount of bases (bp)	23,270,509
Average read length	461
No hit numbers of sequences in Blast	10
Numbers of GC (bp)	11211023
GC contents (%)	48

Plankton species in Hiroshima Bay

Result of Blast search for 50,521 seq.

- Only 3 or 4 sequences hit to bacterial genomes.
- Only 10 sequences did not hit to anything.
- <30 sequences hit to terrestrial plants or insects.

Samples	sequences
Hiroshima Bay (n=5)	33,545
Ishigaki islands (n=5)	15,889
unknown	1,087

Summary of algal data from Hiroshima Bay

Ranking	Phylum	Class	OTUs identified	total OTUs	unidentified OTUs	Identification success %	Total sequence

Total			841	1558	716	54.0	33,301

More registration of sequence to database is needed.

Hiroshima Bay = 1,558 OTUs

Ishigaki island = 1,361 OTUs

	Number of species	Number of Accession
Shared	862	581
Only Ishigaki	489	770

What can we do?

- Record of all components in marine ecosystems

It is possible to cover all components by reading 200,000 seq.

- Good bio-indicators of water quality and useful detection tools for new invasion and comparison of marine biodiversity

This is an effective tool for conservation study of marine environments.

- Quantification of abundances

It will be a more efficient technique for monitoring of planktons.

It will be one of the most powerful monitoring tools.

- Full automatic analyzer in future

Full automatic robot analyzer, from sampling to analysis, is desirable.

Summary of molecular techniques

	accuracy	operability	experience	cost	equipment	quantification
PCR-RFLP	⊙	⊙	⊙	⊙	⊙	X
FISH	○	○	△	⊙	△	○△
SH	⊙	○	○	⊙	X	○
Q-PCR	○	○	△	○	△	○
LAMP	⊙	⊙	⊙	⊙	⊙	X
Multiplex-PCR	⊙	⊙	⊙	⊙	⊙	X
DNA microarray	○	○	○	△X	X	X
metagenome	○	X	X	X	XX	X
	⊙, very good	⊙, very good	⊙, no need	⊙, inexpensive	⊙, inexpensive	⊙, possible

Which is the best technique?

It depends on the purpose and we have to choose it according to our purposes.
