

**Characterization of absorbed  
dose from natural and  
anthropogenic radionuclides for  
the purpose of establishing  
reference points within the  
marine environment**

Delvan Neville  
Kathryn Higley

# Outline

- **Derived Consideration Reference Levels (DCRLs)**
- **Methodology**
- **Data Gaps & Challenges**
- **Northern California Current Estimates**

**Wilson, the Reference Fish**

# DCRLs – ICRP 108

# DCRLs – Why?

- **Animal studies on dose-effect relationships**
  - › **Limited in number**
  - › **Most on mammals (basis for humans)**
  - › **High dose-rates and total doses**
  - › **No other stressors**
- **Derived Consideration Reference Level**
  - › **Baseline of comparison**
  - › **Define bands where concern may be warranted**

**10 uGy?  
You don't scare me,  
I do that every day!**

# Existing Work: NCC Normal Dose

- Folsom & Harley '57
- Holtzman '67
- Woodhead '73
- Brown et al. '04: FASSET
- ICRP 108 '08

**OMG, ICRP!**  
**That's my mommy!**

# Folsom & Harley '57

- Seawater: K-40
- Cosmic rays
- Organism size
  - > Only for betas
  - Discussed
  - Not in calcs

Those fish don't look much like me...

# Holtzman '67

- K-40
- Ra-226 series
  - › Esp. Po-210!
- Cosmic rays
- Organism size
  - › Undefined

**I had no idea I  
was this radioactive  
all the time!**

# Woodhead '73

- **K-40**
- **C-14**
- **H-3**
- **Rb-87**
- **Actinides**

- **Ra-226 series**
  - > **Esp. Po-210!**
  - > **Cosmic rays**
- **Organism size**
  - > **By taxa**
  - > **α/β Penetration**
- **Concentrations**
  - > **By taxa**
  - > **Global Avg. or UK**

**Fish in the UK  
sure look a lot  
different than me...**

Top to bottom, right to left:  
phytoplankton, zooplankton  
mollusc, crab, fish

# FASSET

- Radionuclides as in Woodhead
- Explicitly focused on Europe
- Size & Concentrations
  - › By taxa as in Woodhead
    - Bacteria, macroalgae, mammals added
  - › Uniform concentrations per muscle data
  - › Ellipsoid geometry
  - › Same geometry used in current ICRP RAPs

**Finally! A fish that  
looks a realistic  
as I do!**

# Wilson the Reference Flying Fish

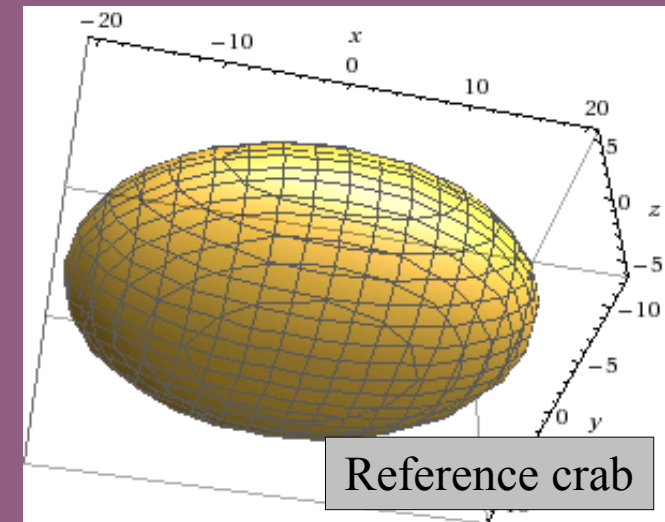

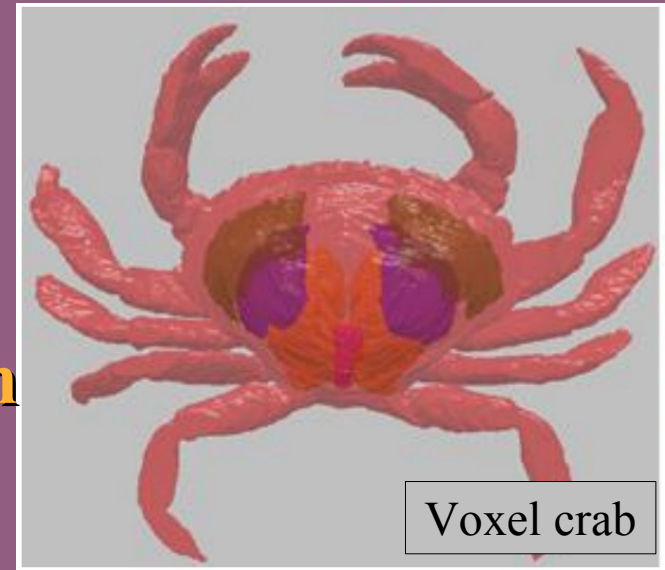

*(Why do you need that helmet just to throw me away?)*

**Please don't throw me away! I'll try harder, I promise!**

# ICRP RAPs - Modern

- **Reference Animals and Plants**
  - › 12 RAPs total
  - › **Ellipsoids, uniform composition**
    - Deer has testes & liver
  - › **Voxels vs. “blobs” underway**
    - No general pattern yet
- **Marine RAPs**
  - › **Crab**
  - › **Flatfish**
  - › **Brown seaweed**
  - › **Primarily benthic\***

\* Several larval flatfish, some juveniles (e.g. sablefish) and larval crabs (Megalopae) are found in the pelagic. The Reference Crab larvae model, however, is identical to a trout egg.

# Methodology: Next Step

- Create voxel model of *Thunnus alalunga*

**Aww, she has  
my nose!**

# Methodology – Next Step

- Compare doses & DCFs for albacore versus:
  - > Scaled trout voxel model
  - > Ellipsoid

**Eww, I can see its insides!!!**

# Methodology – Next Step

- **Geometry**
  - › CT or MRI taken of whole albacore
  - › Organ systems & tissues slice-by-slice
  - › 3D model exported to MCNP
- **Composition**
  - › Density by water displacement
  - › Organic content by FAO data and trout RAP
  - › Trace metal content by fallout CRs

**That looks like  
a lot of work. You  
should probably  
just keep me  
instead.**

# Data Gaps in NCC – Po-210 & Pb-210

- Substantial quantity of whole body data
  - › Sea cucumber / *Paleopatides*
  - › Mixed zooplankton
  - › Benthic *Polychaeta*
  - › Lepas barnacles / *Lepas anatifera*
  - › Copepods / *Acartia clausii*
  - › Pelagic *Polychaeta* / *Tomopteris*
  - › Chaetognaths / *Sagitta elegans*
  - › Shrimp / *Sergestes similis*
  - › Medusae / *Atolla bairdii*
  - › And much, much more...
- Limited tissue specific
  - › Dolphin, myctophids, albacore

**Oh yeah, but  
what about  
marine footballs?  
Didn't think so...**

# Data Gaps in NCC – K-40

- Previous work assumed isotopic abundance
- Effective for any organism with K concentrations known
  - › e.g. Nutrition information for commercial species
- Detectable by gamma spectrometry
  - › Most relevant organisms will be directly assayed
    - Sizes range from euphausiids and up

# Data Gaps in NCC – Less Prominent

- Limited Ra-226 data for NCC biota
  - › Sperm whale, salmon, tuna
  - › Expands to include sea urchin & euphausiids from SCC
- Natural actinides wholly lacking in NCC data
- Cs-137
  - › Until Fukushima, most recent data decades old
  - › Much of the NCC work focused on activation products
- H-3, C-14
  - › Plenty of seawater measurements
  - › Can infer tissue concentrations by isotopic abundance

**Stick with me, and  
you won't need to  
know any of  
those things...**

# Data Gaps: External Sources

- Many differences from human/terrestrial dosimetry
  - › No lungs -> Rn-222 essentially external only
  - › Diurnal vertical migration
    - Cosmic rays shielded
    - Radionuclide vertical gradients
  - › Surrounded by water
    - Electronic equilibrium at skin surface

**No diurnal migration  
for me...I just  
float on the surface :(**

# Dose Estimates

- **Using ICRP RAP closest match**
  - › **Size differences substantial**
  - › **All other inaccuracies in geometry equal to RAPs**
    - **Ellipsoids**
    - **Uniform composition - human tissue**
    - **Uniform distribution of radionuclides**

# Dose Estimates

Dose rate (mGy d <sup>-1</sup> )	Reference Frog	Reference Trout	Reference Rat
10-100	No positive 'effect' information.	Some deleterious effects expected on young fish, e.g., reduction in resistance to infections. Reduced reproductive success.	Reduced reproductive success.
1-10	No positive 'effect' information.	Possible reduced reproductive success.	Possible reduced reproductive success due to reduced fertility in males.
0.1-1	No information.	No information.	No information.

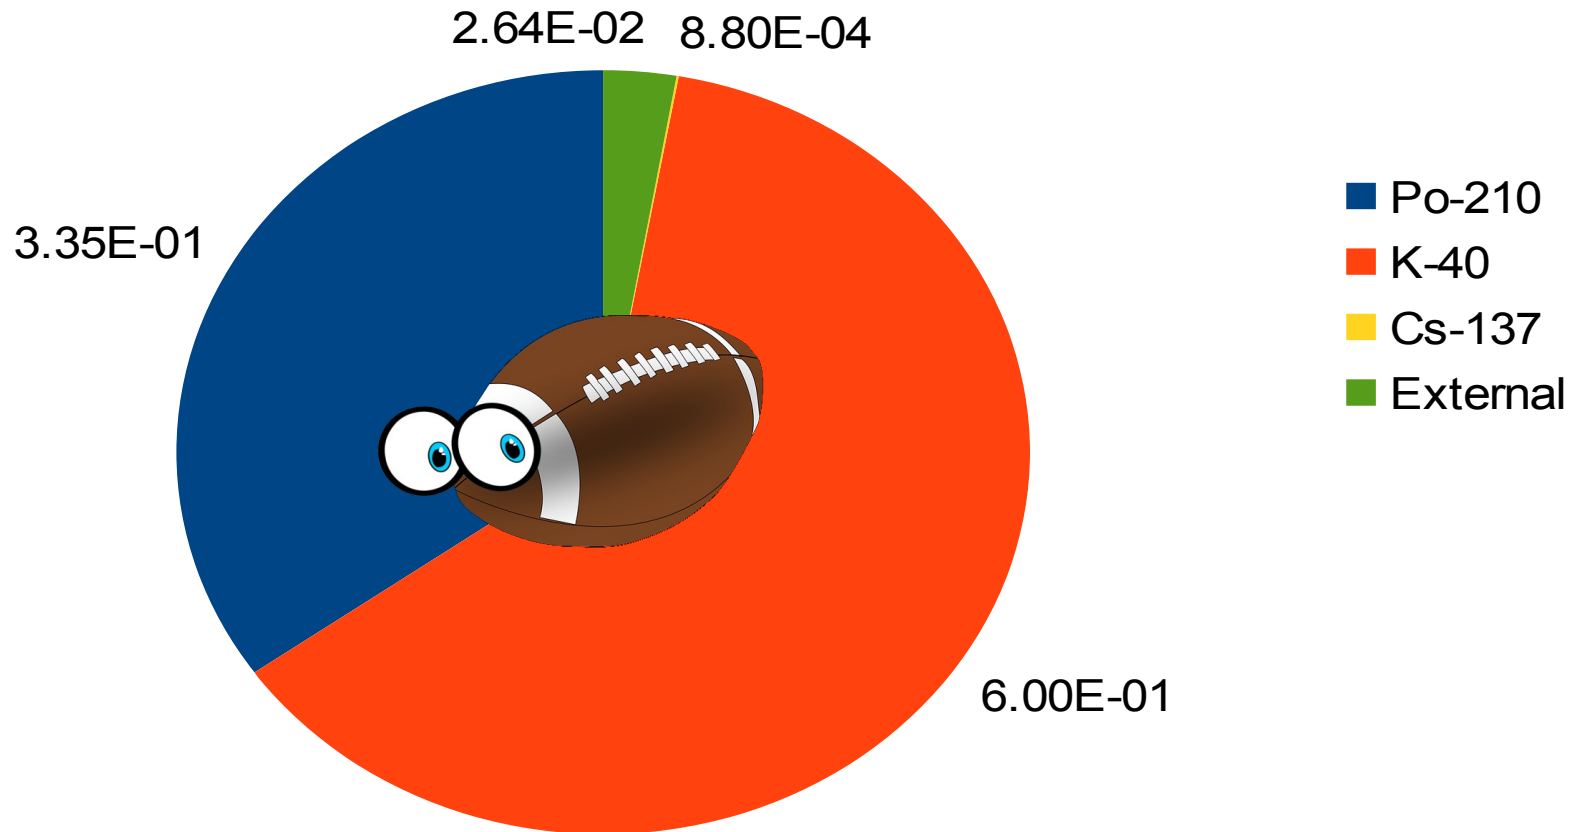

**Reduced reproductive success? But I was made in the Wilson factory...**

# Dose Estimates

Albacore - Beasley 1968 data

Dose rate in uGy/day. Alpha RBE = 5

# Dose Estimates

Albacore - Folsom, Wong & Hodge 1973 data

Dose rate in  $\mu\text{Gy}/\text{day}$ . Alpha RBE = 5

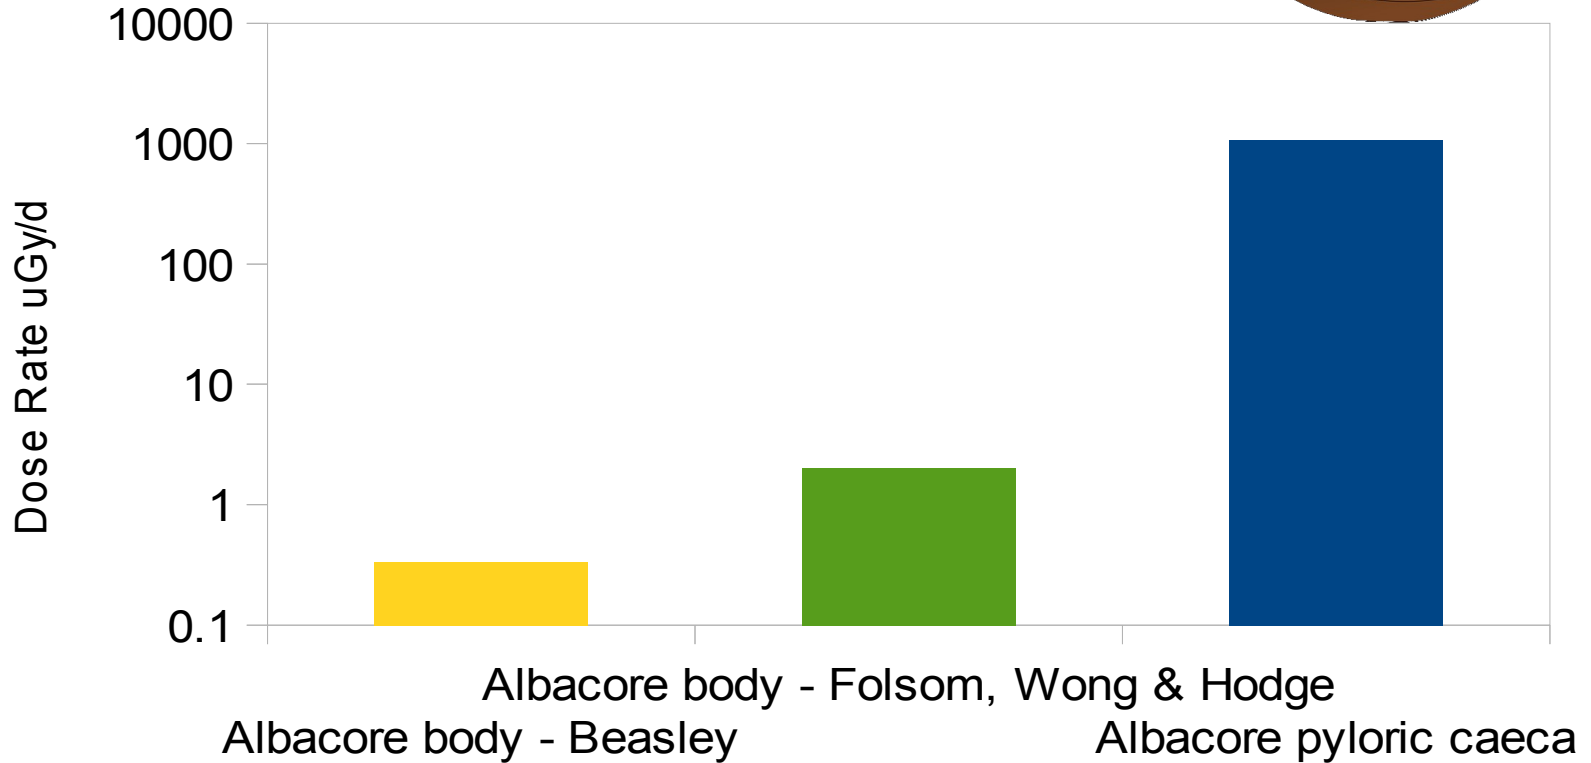

# Dose Estimates

Oww, my caeca...  
wait, what's a caeca?

Po-210 Dose Rates in Albacore tissues

Alpha RBE = 5

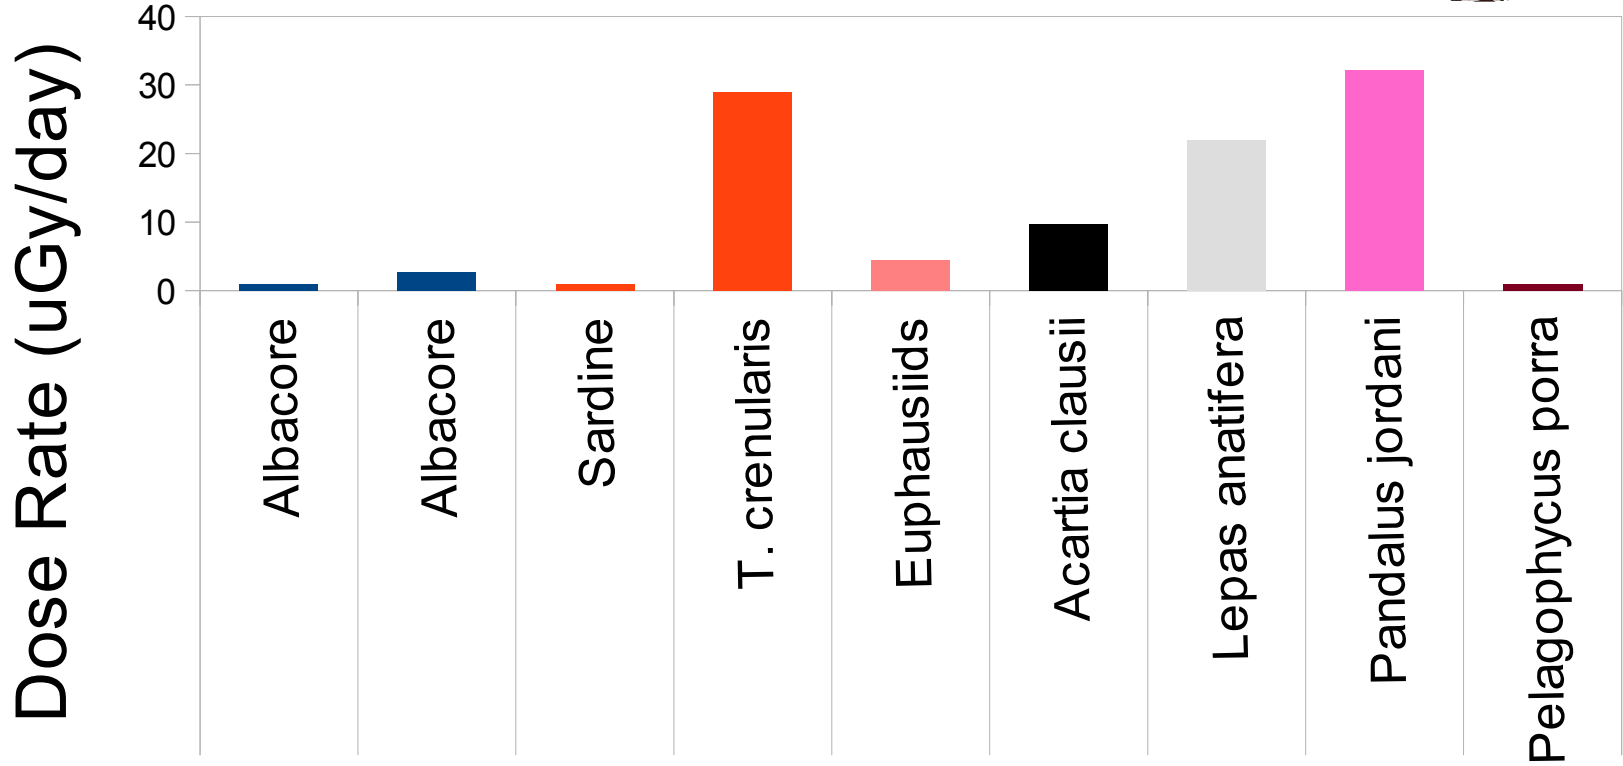

# Dose Estimates

**Epic battle!  
Myctophid vs. Pink Shrimp!  
They both look just like me!**

Dose Rates for Selected NCC Species

Homogenous ellipsoids. Alpha RBE=5

# Dose Estimates

**Epic battle!**  
**Myctophid vs. Pink Shrimp!**  
**They both look just like me!**

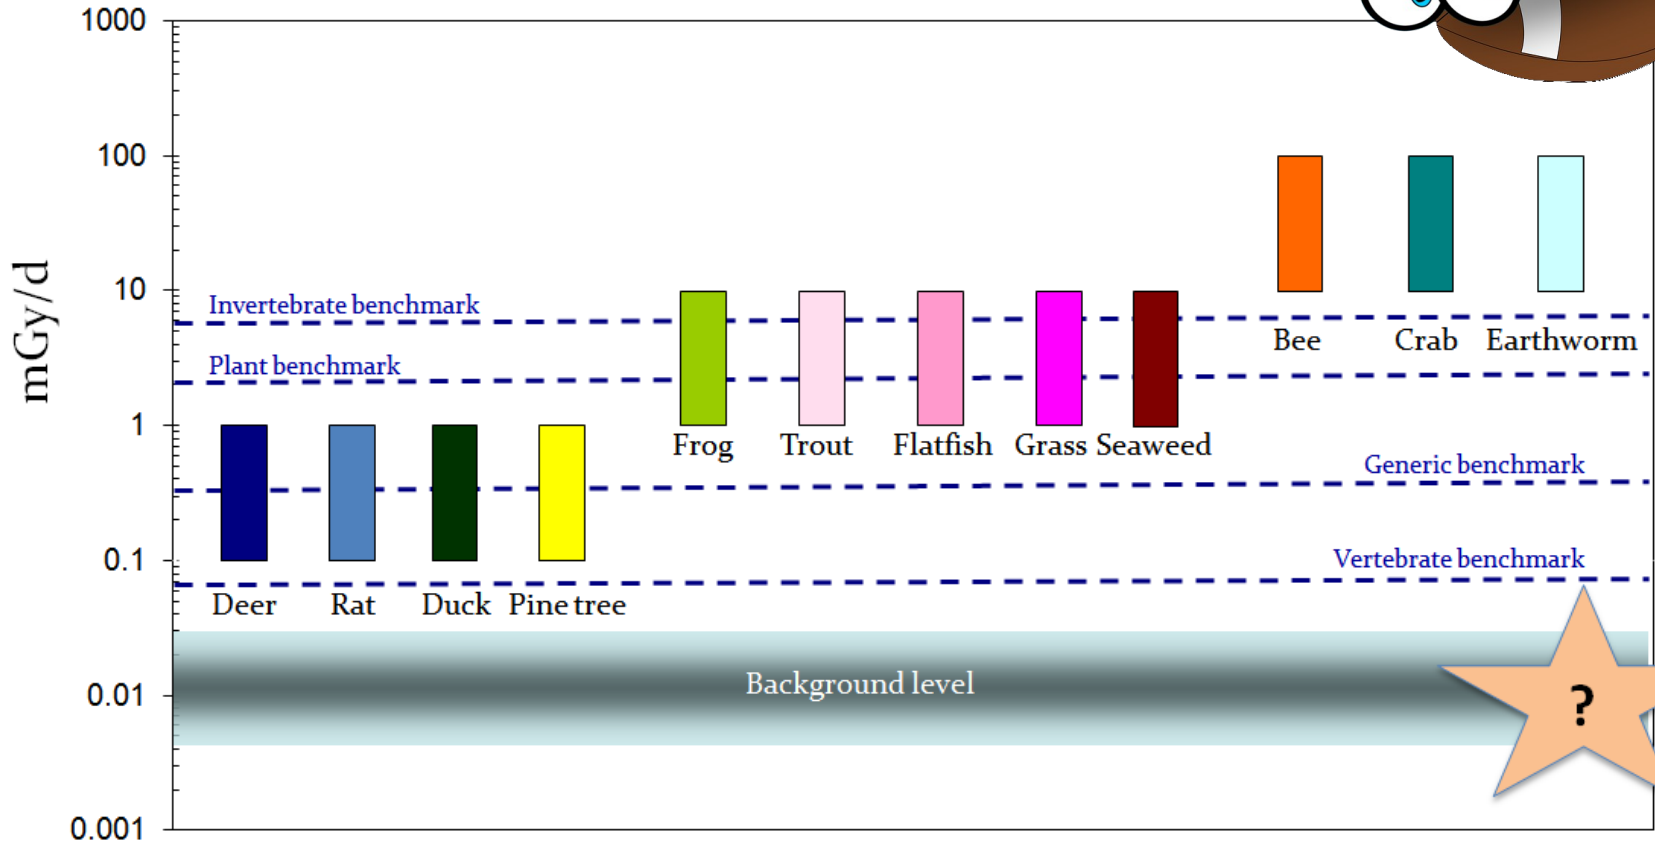

## Dose Rates for Selected NCC Species

Homogenous ellipsoids. Alpha RBE=5

# DCRLs – ICRP 108

**This looks familiar**

Benchmarks from other studies/systems  
 -----

# DCRLs – ICRP 108

**Whoah! Keep ducks out of the ocean!**

Peak background in marine examples

Generic benchmark

Benchmarks from other studies/systems
